

## GDB QUICK REFERENCE GDB Version 4

## Breakpoints and Watchpoints

### Essential Commands

<code>gdb program [core]</code>	debug <i>program</i> [using coredump <i>core</i> ]	<code>b [file]:line</code>	set breakpoint at <i>line</i> number [in <i>file</i> ] eg: <code>break main.c:37</code>
<code>b [file]:function</code>	set breakpoint at <i>function</i> [in <i>file</i> ]	<code>break [file]:func</code>	set breakpoint at <i>func</i> [in <i>file</i> ]
<code>run [arglist]</code>	start your program [with <i>arglist</i> ]	<code>break +offset</code>	set break at <i>offset</i> lines from current stop
<code>bt</code>	backtrace: display program stack	<code>break *addr</code>	set breakpoint at address <i>addr</i>
<code>p expr</code>	display the value of an expression	<code>break ... if expr</code>	set breakpoint at next instruction break conditionally on nonzero <i>expr</i>
<code>c</code>	continue running your program	<code>cond n [expr]</code>	new conditional expression on breakpoint <i>n</i> : make unconditional if no <i>expr</i>
<code>n</code>	next line, stepping over function calls	<code>tbreak ...</code>	temporary break; disable when reached
<code>s</code>	next line, stepping into function calls	<code>rbreak regex</code>	set a breakpoint for expression <i>expr</i>
		<code>watch expr</code>	break at C++ handler for exception <i>x</i>
		<code>catch x</code>	
		<code>info break</code>	show defined breakpoints
		<code>info watch</code>	show defined watchpoints
		<code>clear</code>	delete breakpoints at next instruction
		<code>clear [file]:fun</code>	delete breakpoints at entry to <i>fun()</i>
		<code>clear [file]:line</code>	delete breakpoints on source line
		<code>delete [n]</code>	delete breakpoints [or breakpoint <i>n</i> ]
		<code>disable [n]</code>	disable breakpoints [or breakpoint <i>n</i> ]
		<code>enable [n]</code>	enable breakpoints [or breakpoint <i>n</i> ]
		<code>enable once [n]</code>	enable breakpoints [or breakpoint <i>n</i> ]; disable again when reached
		<code>enable del [n]</code>	enable breakpoints [or breakpoint <i>n</i> ]; delete when reached
		<code>ignore n count</code>	ignore breakpoint <i>n</i> , <i>count</i> times
		<code>commands n</code>	execute GDB command-list every time breakpoint <i>n</i> is reached.
		<code>[silent] command-list</code>	[silent] suppresses default display
		<code>end</code>	end of command-list

### Getting Help

`help` list classes of commands  
`help class` one-line descriptions for commands in  
`class`  
`help command` describe *command*

### Stopping GDB

`quit` exit GDB; also `q` or `EOF` (eg C-d)  
`INTERRUPT` (eg C-c) terminate current command, or  
send to running process

### Execution Control

<code>continue [count]</code>	continue running; if <i>count</i> specified, ignore this breakpoint next <i>count</i> times
<code>c [count]</code>	stop [count]
<code>step [count]</code>	step [count]
<code>s [count]</code>	stepi [count]
<code>si [count]</code>	si [count]
<code>next [count]</code>	next [count]
<code>n [count]</code>	ni [count]
<code>ni [count]</code>	next machine instruction rather than source line
<code>until [location]</code>	run until next instruction (or <i>location</i> )
<code>finish</code>	run until selected stack frame returns
<code>return [expr]</code>	pop selected stack frame without executing [setting return value]
<code>signal num</code>	resume execution with signal <i>s</i> (none if 0)
<code>jump line</code>	resume execution at specified <i>line</i> number
<code>jump *address</code>	or <i>address</i> evaluate <i>expr</i> without displaying it; use for altering program variables
<code>set var=expr</code>	

### Display

<code>print [/f] [expr]</code>	show value of <i>expr</i> [or last value \$] according to format <i>f</i>
<code>p [/f] [expr]</code>	hexadecimal
<code>x</code>	signed decimal
<code>d</code>	unsigned decimal
<code>u</code>	octal
<code>o</code>	binary
<code>t</code>	address, absolute and relative character
<code>a</code>	floating point
<code>c</code>	like print but does not display <code>void</code>
<code>f</code>	examine memory at address <i>expr</i> ; optional format spec follows slash
<code>x [/Nuf] expr</code>	count of how many units to display unit size; one of b individual bytes h halfwords (two bytes) w words (four bytes) g giant words (eight bytes)
<code>N</code>	count of how many units to display
<code>u</code>	unit size; one of b individual bytes h halfwords (two bytes) w words (four bytes) g giant words (eight bytes)
<code>call [/f] expr</code>	<i>f</i>
<code>end</code>	

### Program Stack

<code>backtrace [n]</code>	print trace of all frames in stack; or of <i>n</i> frames—innermost if <i>n</i> >0, outermost if <i>n</i> <0
<code>bt [n]</code>	select frame number <i>n</i> or frame at address <i>n</i> ; if no <i>n</i> , display current frame
<code>frame [n]</code>	select frame <i>n</i> frames up
<code>up n</code>	select frame <i>n</i> frames down
<code>down n</code>	describe selected frame, or frame at <i>addr</i>
<code>info frame [addr]</code>	arguments of selected frame
<code>info args</code>	local variables of selected frame
<code>info locals</code>	register values [for regs <i>m</i> ] in selected frame; <code>all-reg</code> includes floating point
<code>info reg [m]...</code>	exception handlers active in selected frame
<code>info all-reg [m]</code>	
<code>info catch</code>	

### Shell Commands

<code>cd dir</code>	change working directory to <i>dir</i>
<code>pwd</code>	Print working directory
<code>make</code>	call "make"
<code>shell cmd</code>	execute arbitrary shell command string

<code>[[ surround optional arguments</code>	... show one or more arguments
<code>Permissions on back</code>	
<code>]]</code>	
<code>remove number(s) <i>n</i> from list of</code>	automatically displayed expressions
<code>display all enabled expressions on list</code>	disables display for expression(s) number <i>n</i>
<code>enable disp <i>n</i></code>	enable display for expression(s) number <i>n</i>
<code>info display</code>	numbered list of display expressions

## Expressions

<i>expr</i>	an expression in C, C++, or Modula-2 (including function calls), or: an array of <i>len</i> elements beginning at <i>addr</i>
<i>addr@len</i>	a variable or function <i>nm</i> defined in <i>file</i>
<i>file : nm</i>	read memory at <i>addr</i> as specified <i>type</i>
<i>[type] addr</i>	most recent displayed value
<i>\$</i>	nth displayed value
<i>\$n</i>	displayed value previous to \$
<i>\$\$</i>	nth displayed value back from \$
<i>-\$</i>	last address examined with <b>x</b>
<i>\$-</i>	value at address \$ - convenience variable; assign any value
<i>\$var</i>	show values [n]
<b>show conv</b>	show last 10 values [or surrounding \$n] display all convenience variables

## Symbol Table

<b>info address</b> <i>s</i>	show where symbol <i>s</i> is stored
<b>info func</b> [ <i>regex</i> ]	show names, types of defined functions (all, or matching <i>regex</i> )
<b>info var</b> [ <i>regex</i> ]	show names, types of global variables (all, or matching <i>regex</i> )
<b>whatis</b> [ <i>expr</i> ]	show data type of <i>expr</i> [or \$] without evaluating; <b>ptype</b> gives more detail
<b>ptype</b> [ <i>expr</i> ]	describe type, struct, union, or enum
<b>ptype type</b>	

## GDB Scripts

<b>source</b> <i>script</i>	read, execute GDB commands from file <i>script</i>
<b>define</b> <i>cmd</i> <i>command-list</i>	create new GDB command <i>cmd</i> ; execute script defined by <i>command-list</i>
<b>end</b>	end of <i>command-list</i>
<b>document</b> <i>cmd</i> <i>help-text</i>	create online documentation for new GDB command <i>cmd</i> end of <i>help-text</i>
<b>end</b>	

## Signals

<b>handle</b> <i>signal</i> <i>act</i>	specify GDB actions for <i>signal</i> :
<b>print</b>	announce signal
<b>noprint</b>	be silent for signal
<b>stop</b>	halt execution on signal
<b>nostop</b>	do not halt execution
<b>Pass</b>	allow your program to handle signal
<b>nopass</b>	do not allow your program to see signal
<b>info signals</b>	show table of signals, GDB action for each

## Debugging Targets

<b>target</b> <i>type</i> <i>param</i>	connect to target machine, process, or file
<b>help target</b>	display available targets
<b>attach</b> <i>param</i>	connect to another process
<b>detach</b>	release target from GDB control

## Controlling GDB

<b>set param</b> <i>value</i>	set one of GDB's internal parameters
<b>show param</b>	display current setting of parameter
Parameters understood by <b>set</b> and <b>show</b> :	
<b>complaint limit</b>	number of messages on unusual symbols
<b>confirm</b> <i>on/off</i>	enable or disable cautionary queries
<b>editing</b> <i>on/off</i>	control readline command-line editing
<b>height</b> <i>fp</i>	number of lines before pause in display
<b>language</b> <i>lang</i>	Language for GDB expressions ( <b>auto</b> , <b>c</b> or <b>modula-2</b> )
<b>listsize</b> <i>n</i>	number of lines shown by <b>list</b>
<b>prompt</b> <i>str</i>	use <i>str</i> as GDB prompt
<b>radix</b> <i>base</i>	octal, decimal, or hex number representation
<b>verbose</b> <i>on/off</i>	control messages when loading symbols
<b>width</b> <i>cp1</i>	number of characters before line folded (when reopened with <b>exec</b> or <b>core</b> )
<b>write</b> <i>on/off</i>	Allow or forbid patching binary, core files
<b>history</b> ...	groups with the following options:
<b>h</b> ...	print ...
<b>h exp</b> <i>off/on</i>	groups with the following options:
<b>h file</b> <i>filename</i>	<b>p</b> ...
<b>h size</b> <i>size</i>	<b>P</b> address <i>on/off</i> print memory addresses in stacks, values <b>P array</b> <i>off/on</i> compact or attractive format for arrays
<b>h save</b> <i>off/on</i>	<b>P demangl</b> <i>on/off</i> source (demangled) or internal form for C++ symbols
	<b>P asm-dem</b> <i>on/off</i> demangle C++ symbols in machine- instruction output
	<b>P elements</b> <i>limit</i> number of array elements to display
	<b>P object</b> <i>on/off</i> print C++ derived types for objects
	<b>P pretty</b> <i>off/on</i> struct display: compact or indented
	<b>P union</b> <i>on/off</i> display of union members
	<b>P vtbl</b> <i>off/on</i> display of C++ virtual function tables
<b>show commands</b>	show last 10 commands
<b>show commands</b> <i>n</i>	show 10 commands around number <i>n</i>
<b>show commands</b> +	show next 10 commands

## Source Files

<b>dir</b> <i>names</i>	add directory <i>names</i> to front of source path
<b>clear</b>	clear source path
<b>show</b>	show current source path
<b>list</b> <i>-</i> <i>lines</i>	show next ten lines of source
<b>list</b> <i>-</i>	show previous ten lines
<b>list</b> <i>lines</i>	display source surrounding <i>lines</i> , specified as:
<b>[file]:num</b>	line number [in named file]
<b>[file]:function</b>	beginning of function [in named file]
<b>+off</b>	<b>off</b> lines after last printed
<b>-off</b>	<b>off</b> lines previous to last printed
<b>*address</b>	line containing <i>address</i>
<b>list</b> <i>f,l</i>	from line <i>f</i> to line <i>l</i>
<b>info line</b> <i>num</i>	show starting, ending addresses of compiled code for source line <i>num</i>
<b>info sources</b>	show name of current source file
<b>forw</b> <i>regx</i>	list all source files in use
<b>rev</b> <i>regx</i>	search following source lines for <i>regx</i>
<b>rev</b> <i>regx</i>	search preceding source lines for <i>regx</i>

## GDB under GNU Emacs

<b>M-x gdb</b>	run GDB under Emacs
<b>describe</b>	describe GDB mode
<b>step</b>	step one line ( <b>step</b> )
<b>next</b>	next line ( <b>next</b> )
<b>step</b>	step one instruction ( <b>stepi</b> )
<b>finish</b>	finish current stack frame ( <b>finиш</b> )
<b>continue</b>	continue ( <b>cont</b> )
<b>up</b>	up <i>arg</i> frames ( <b>up</b> )
<b>down</b>	down <i>arg</i> frames ( <b>down</b> )
<b>C-x &amp;</b>	copy number from point, insert at end (in source file)
<b>C-x SPC</b>	set break at point
<b>show copying</b>	Display GNU General Public License
<b>show warranty</b>	There is NO WARRANTY for GDB. Display full no-warranty statement.

## Working Files

<b>file</b> [ <i>file</i> ]	use <i>file</i> for both symbols and executables; with no arg, discard both
<b>core</b> [ <i>file</i> ]	read <i>file</i> as coredump; or discard
<b>exec</b> [ <i>file</i> ]	use <i>file</i> as executable only; or discard
<b>symbol</b> [ <i>file</i> ]	use symbol table from <i>file</i> ; or discard
<b>load</b> <i>file</i>	dynamically link <i>file</i> and add its symbols
<b>add-sym</b> <i>file</i> <i>addr</i>	read additional symbols from <i>file</i> , dynamically loaded at <i>addr</i>
<b>info files</b>	display working files and targets in use
<b>path</b> <i>dirs</i>	add <i>dirs</i> to front of path searched for executable and symbol files
<b>show path</b>	display executable and symbol file path
<b>info share</b>	list names of shared libraries currently loaded
