

Turing Machines

Part II

Problem Set Five due
in the box up front
using a late day.

The Turing Machine

- A Turing machine consists of three parts:
 - A **finite-state control** that issues commands,
 - an **infinite tape** for input and scratch space, and
 - a **tape head** that can read and write a single tape cell.
- At each step, the Turing machine
 - writes a symbol to the tape cell under the tape head,
 - changes state, and
 - moves the tape head to the left or to the right.

$\square \rightarrow \square, R$
 $0 \rightarrow 0, R$

Key Idea: Subroutines

- A **subroutine** of a Turing machine is a small set of states in the TM such that performs a small computation.
- Usually, a single entry state and a single exit state.
- Many very complicated tasks can be performed by TMs by breaking those tasks into smaller subroutines.

Turing Machines and Math

- Turing machines are capable of performing
 - Addition
 - Subtraction
 - Multiplication
 - Integer division
 - Exponentiation
 - Integer logarithms
 - **Plus a whole lot more...**

Outline for Today

- **List Processing**
 - Turing machines that operate on sequences.
- **Exhaustive Search**
 - A fundamentally different approach to designing Turing machines.
- **Nondeterministic Turing Machines**
 - What does a Turing machine with Magic Superpowers look like?
- **The Church-Turing Thesis (ITA)**
 - Just how powerful *are* Turing machines?

List Processing

- Suppose we have a list of strings represented as

$$w_1 : w_2 : \dots : w_n :$$

- What sorts of transformations can we perform on this list using a Turing machine?

Example: Take Odds

- Given a list of $2n$ strings encoded as follows:

$$w_1 : w_2 : \dots : w_{2n} :$$

filter the list to get back just the odd-numbered entries:

$$w_1 : w_3 : \dots : w_{2n-1} :$$

- How might we do this with a Turing machine?

Taking Odds

Turing Machine Memory

- Turing machines often contain many seemingly replicated states in order to store a finite amount of extra information.
- A Turing machine can remember one of k different constants by copying its states k times, once for each possible value, and wiring those states appropriately.

Turing Machines and Lists

- Turing machines can perform many operations on lists:
 - Concatenate two lists.
 - Reverse a list.
 - Sort a list.
 - Find the maximum element of a list.
 - **And a whole lot more!**

The Power of Turing Machines

- Turing machines can
 - Perform standard arithmetic operations (addition, subtraction, multiplication, division, exponentiation, etc.)
 - Manipulate lists of elements (searching, sorting, reversing, etc.)
- What else can Turing machines do?

The Hailstone Sequence

- Consider the following procedure, starting with some $n \in \mathbb{N}$, where $n > 0$:
 - If $n = 1$, you are done.
 - If n is even, set $n = n / 2$.
 - Otherwise, set $n = 3n + 1$.
 - Repeat.
- Question: Given a number n , does this process terminate?

- If $n = 1$, stop.
- If n is even, set $n = n / 2$.
- Otherwise, set $n = 3n + 1$.
- Repeat.

The Hailstone Sequence

- Let $\Sigma = \{\mathbf{1}\}$ and consider the language
$$L = \{ \mathbf{1}^n \mid n > 0 \text{ and the hailstone sequence terminates for } n \}.$$
- Could we build a TM for L ?

The Hailstone Turing Machine

- Intuitively, we can build a TM for the hailstone language as follows: the machine M does the following:
 - If the input is ε , reject.
 - While the input is not **1**:
 - If the input has even length, halve the length of the string.
 - If the input has odd length, triple the length of the string and append a **1**.
 - Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ϵ , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ϵ , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ϵ , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

...			1	1	1	1	1	1	1	1	1	1	1	1	1	1	1		...
-----	--	--	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	--	-----

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length of the string.
- If the input has odd length string and append a **1**.

Accept.

Interesting problem:
Build a TM that, starting with n **1**s on its tape, ends with $3n + 1$ **1**s on its tape.

The Hailstone Turing Machine

...			1	1	1	1	1	1	1	1	1	1	1	1	1	1	1		...
-----	--	--	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	--	-----

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

-----	--	--	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	--	-----

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ϵ , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

...			1	1	1	1	1	1	1	1	1	1	1	1	1	1	1		...
-----	--	--	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	--	-----

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

The Hailstone Turing Machine

...			1	1	1	1	1	1	1	1	1	1	1	1	1	1	1		...
-----	--	--	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	--	-----

If the input is ε , reject.

While the input is not **1**:

- If the input has even length, halve the length of the string.
- If the input has odd length, triple the length of the string and append a **1**.

Accept.

Accept.

Does this Turing machine always accept?

The Collatz Conjecture

- It is *unknown* whether this process will terminate for all natural numbers.
- In other words, ***no one knows whether the TM described in the previous slides will always stop running!***
- The conjecture (claim) that this always terminates is called the **Collatz Conjecture**.

An Important Observation

- Unlike the other automata we've seen so far, Turing machines choose for themselves whether to accept or reject.
- It is therefore possible for a TM to run forever without accepting or rejecting.

Some Important Terminology

- Let M be a Turing machine.
- M **accepts** a string w if it enters the accept state when run on w .
- M **rejects** a string w if it enters the reject state when run on w .
- M **loops infinitely** (or just **loops**) on a string w if when run on w it enters neither the accept or reject state.
- M **does not accept w** if it either rejects w or loops infinitely on w .
- M **does not reject w** if it either accepts w or loops on w .
- M **halts on w** if it accepts w or rejects w .

The Language of a TM

- The language of a Turing machine M , denoted $\mathcal{L}(M)$, is the set of all strings that M accepts:

$$\mathcal{L}(M) = \{ w \in \Sigma^* \mid M \text{ accepts } w \}$$

- For any $w \in \mathcal{L}(M)$, M accepts w .
- For any $w \notin \mathcal{L}(M)$, M does not accept w .
 - It might loop forever, or it might explicitly reject.
- A language is called **recognizable** iff it is the language of some TM.
- Notation: **RE** is the set of all recognizable languages.

$$L \in \mathbf{RE} \quad \text{iff} \quad L \text{ is recognizable}$$

Time Out For Announcements!

Office Hours Schedule

- We've update our office hours schedule to shift office hours more toward Monday.
- Check the website for the updated schedule!

Your Questions!

“What is your favorite 103 topic and why?”

stay tuned...
we're about to
get there!

Worklist Algorithms

- A) Double the contents of the string after **M**.
- B) Replace **III** with **U**.
- C) Remove **UU**
- D) Append **U** if the string ends in **I**.

A Recognizable Language

- Let $\Sigma = \{ \mathbf{M}, \mathbf{I}, \mathbf{U} \}$ and consider the language $L = \{ w \in \Sigma^* \mid \text{Using the four provided rules, it is possible to convert } w \text{ into } \mathbf{MU} \}$
- Some strings are in this language (for example, $\mathbf{MU} \in L$, $\mathbf{MIII} \in L$, $\mathbf{MUUU} \in L$).
- Some strings are not in this language (for example, $\mathbf{I} \notin L$, $\mathbf{MI} \notin L$, $\mathbf{MIIU} \notin L$).
- Could we build a Turing machine for L ?

TM Design Trick: Worklists

- It is possible to design TMs that search over an infinite space using a worklist.
- Conceptually, the TM
 - Finds all possible options one step away from the original input,
 - Appends each of them to the end of the worklist,
 - Clears the current option, then
 - Grabs the next element from the worklist to process.
- **This Turing machine is not guaranteed to halt.**

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

A Sketch of the Turing Machine

To recognize L , our TM M does the following:

- While M has not found the string **MU**:
 - M grabs the next string from the worklist.
 - For each possible single step, M performs that step and appends the result to the worklist.

The Power of TMs

- The worklist approach makes that all of the following languages are recognizable:
 - Any context-free language: simulate all possible production rules and see if the target string can be derived.
 - Solving a maze – use the worklist to explore all paths of length 0, 1, 2, ... until a solution is found.
 - Determining whether a polynomial has an integer zeros: try 0, -1, +1, -2, +2, -3, +3, ... until a result is found.

Searching and Guessing

Nondeterminism Revisited

- Recall: One intuition for nondeterminism is **perfect guessing**.
 - The machine has many options, and somehow magically knows which guess to make.
- With regular languages, we could generalize DFAs with NFAs.
- What happens if we do this for Turing machines?

Nondeterministic TMs

- A **nondeterministic Turing machine** (or **NTM**) is a variant on a Turing machine where there can be any number of transitions for a given state/tape symbol combination.
 - Notation: “Turing machine” or “TM” refers to a deterministic Turing machine unless specified otherwise. The term **DTM** specifically represents a deterministic TM.
- The NTM accepts iff there is *some possible series of choices* it can make such that it accepts.

Questions for Now

- How can we build an intuition for nondeterministic Turing machines?
- What sorts of problems can we solve with NTMs?
- What is the relative power of NTMs and DTMs?

Designing NTMs

- When designing NTMs, it is often useful to use the approach of guess and check:
 - **Nondeterministically** guess some object that can “prove” that $w \in L$.
 - **Deterministically** verify that you have guessed the right object.
- If $w \in L$, there will be some guess that causes the machine to accept.
- If $w \notin L$, then no guess will ever cause the machine to accept.

Composite Numbers

- A natural number $n \geq 2$ is called **composite** iff it has a factor other than 1 and n .
- Equivalently: there are two natural numbers $r \geq 2$ and $s \geq 2$ such that $rs = n$.
- Let $\Sigma = \{1\}$ and consider the language
$$L = \{ 1^n \mid n \text{ is composite} \}$$
- How might we design an NTM for L ?

A Sketch of the NTM

- We saw how to build a TM that checks for correct multiplication.
- Have our NTM
 - **Nondeterministically** guess two factors, then
 - **Deterministically** run the multiplication TM.

A Sketch of the NTM

- We saw how to build a TM that checks for correct multiplication.
- Have our NTM
 - **Nondeterministically** guess two factors, then
 - **Deterministically** run the multiplication TM.

... 1 1 × 1 1 1 1 1 = 1 1 1 1 1 1 1 1 1 1 ...

Nondeterminism and States

- When working with NFAs, we could think of the NFA as being in multiple states at the same time.
- **You cannot think of NTMs this way.**
- In NFAs, the only memory is the current state. In an NTM, memory includes the current state and the tape contents.
- If you're using the “massive parallelism” intuition, think about the machine cloning itself for all possible next steps, with each machine getting its own copy of the tape.

Designing NTMs

- Suppose that we have a CFG G .
- Can we build a TM M where $\mathcal{L}(M) = \mathcal{L}(G)$?
- **Idea:** Nondeterministically guess which productions ought to be applied.
 - Keep the original string on the input tape.
 - Keep guessing productions until no nonterminals remain.
 - Accept if the resulting string matches.

The Story So Far

- We now have two different models of solving search problems:
 - Build a worklist and explicitly step through all options.
 - Use a nondeterministic Turing machine.
- Are these two approaches equivalent?
- That is, are NTMs and DTMs equal in power?

Next Time

- **The Church-Turing Thesis**
 - Just how powerful *are* Turing machines?
- **Encodings**
 - How do we compute over arbitrary objects?
- **The Universal Turing Machine**
 - Can TMs compute over themselves?
- **The Limits of Turing Machines (ITA)**
 - A language not in **RE**.
