# Reducibility Part II 

Problem Set 7
due in the box up front.

## The General Pattern

Machine $H$
$H=$ "On input $w$ :

- Transform the input $w$ into $f(w)$.
- Run machine $R$ on $f(w)$.
- If $R$ accepts $f(w)$, then $H$ accepts $w$.
- If $R$ rejects $f(w)$, then $H$ rejects $w . "$

## Defining Reductions

- A reduction from $A$ to $B$ is a function $f: \Sigma_{1}^{*} \rightarrow \Sigma_{2}{ }^{*}$ such that

For any $w \in \Sigma_{1}{ }^{*}, w \in A$ iff $f(w) \in B$
$\square$

## Defining Reductions

- A reduction from $A$ to $B$ is a function $f: \Sigma_{1}{ }^{*} \rightarrow \Sigma_{2}{ }^{*}$ such that
For any $w \in \Sigma_{1}{ }^{*}, w \in A$ iff $f(w) \in B$

## Defining Reductions

- A reduction from $A$ to $B$ is a function $f: \Sigma_{1}^{*} \rightarrow \Sigma_{2}{ }^{*}$ such that
For any $w \in \Sigma_{1}{ }^{*}, w \in A$ iff $f(w) \in B$

## Defining Reductions

- A reduction from $A$ to $B$ is a function $f: \Sigma_{1}{ }^{*} \rightarrow \Sigma_{2}{ }^{*}$ such that

For any $w \in \Sigma_{1}{ }^{*}, w \in A$ iff $f(w) \in B$

- Every $w \in A$ maps to some $f(w) \in B$.
- Every $w \notin A$ maps to some $f(w) \notin B$.
- $f$ does not have to be injective or surjective.

## $w \in A \quad$ iff $\quad f(w) \in B$

Machine $H$
$H=$ "On input $w$ :

- Transform the input $w$ into $f(w)$.
- Run machine $R$ on $f(w)$.
- If $R$ accepts $f(w)$, then $H$ accepts $w$.
- If $R$ rejects $f(w)$, then $H$ rejects $w$. ."

## $H$ accepts $w$ iff <br> $R$ accepts $\boldsymbol{f}(\boldsymbol{w})$ <br> iff <br> $f(w) \in B$ <br> iff <br> $w \in \mathbf{A}$

## Mapping Reductions

- A function $f: \Sigma_{1}^{*} \rightarrow \Sigma_{2}^{*}$ is called a mapping reduction from $A$ to $B$ iff
- For any $w \in \Sigma_{1}^{*}, w \in A$ iff $f(w) \in B$.
- $f$ is a computable function.
- Intuitively, a mapping reduction from $A$ to $B$ says that a computer can transform any instance of $A$ into an instance of $B$ such that the answer to $B$ is the answer to $A$.

## Mapping Reducibility

- If there is a mapping reduction from language $A$ to language $B$, we say that language $A$ is mapping reducible to language $B$.
- Notation: $\boldsymbol{A} \leq_{\mathbf{M}} \boldsymbol{B}$ iff language $A$ is mapping reducible to language $B$.
- Note that we reduce languages, not machines.

## Why Mapping Reducibility Matters

- Theorem: If $B \in \mathbf{R}$ and $A \leq_{\mathrm{M}} B$, then $A \in \mathbf{R}$.
- Theorem: If $B \in \mathbf{R E}$ and $A \leq_{\mathrm{M}} B$, then $A \in \mathbf{R E}$.
- Theorem: If $B \in \operatorname{co-RE}$ and $A \leq_{\mathrm{M}} B$, then $A \in$ co-RE.
- Intuitively: $A \leq_{\mathrm{M}} B$ means " $A$ is not harder than $B$."

## Why Mapping Reducibility Matters

- Theorem: If $A \notin \mathbf{R}$ and $A \leq_{\mathrm{M}} B$, then $B \notin \mathbf{R}$.
- Theorem: If $A \notin \mathbf{R E}$ and $A \leq_{\mathrm{M}} B$, then $B \notin \mathbf{R E}$.
- Theorem: If $A \notin \operatorname{co-RE}$ and $A \leq_{M} B$, then $B \notin \mathrm{co}-\mathbf{R E}$.
- Intuitively: $A \leq_{\mathrm{M}} B$ means " $B$ is at at least as hard as $A$."

## Why Mapping Reducibility Matters

If this one is "easy" ( $R, R E, C O-R E$ )...

$$
A \leq_{\mathrm{M}} B
$$

... then this one is
"easy" ( $R, R E$, co-RE) too.

## Why Mapping Reducibility Matters

If this one is "hard"
(not $R$, not RE, or not

$$
c o-R E) . . .
$$

$$
A \leq_{\mathrm{M}} B
$$

then this one is "hard" (not R, not RE, or not co-RE) too.

## Using Mapping Reductions

## Revisiting our Proofs

- Consider the language

$$
L=\{\langle M\rangle \mid M \text { is a TM and } M \text { accepts } \varepsilon\}
$$

- We have already proven that this language is in RE by building a TM for it.
- Let's repeat this proof using mapping reductions.
- Specifically, we will prove

$$
L \leq_{\mathrm{M}} \mathbf{A}_{\mathrm{TM}}
$$

## $L=\{\langle M\rangle \mid M$ is a TM and $M$ accepts $\varepsilon\}$

- To prove $L \leq_{M} A_{T M}$, we will need to find a computable function $f$ such that

$$
\langle M\rangle \in L \quad \text { iff } \quad f(\langle M\rangle) \in \mathbf{A}_{\mathrm{TM}}
$$

- Since $A_{\text {TM }}$ is a language of TM/string pairs, let's assume $f(\langle M\rangle)=\langle N, w\rangle$ for some TM $N$ and string $w$ (which we'll pick later):

$$
\langle M\rangle \in L \quad \text { iff } \quad\langle N, w\rangle \in \mathbf{A}_{\text {тм }}
$$

- Substituting definitions:

## $M$ accepts $\varepsilon$ iff $N$ accepts $w$

- Choose $\boldsymbol{N}=\boldsymbol{M}, \boldsymbol{w}=\boldsymbol{\varepsilon}$. So $\boldsymbol{f}(\langle\boldsymbol{M}\rangle)=\langle\boldsymbol{M}, \boldsymbol{\varepsilon}\rangle$.

## One Interpretation of the Reduction

## One Interpretation of the Reduction

## $\langle M\rangle$

- Compute $f$

## $\langle M, \varepsilon\rangle$ Recognizer for $\mathrm{A}_{\mathrm{TM}}$

## Machine $R$

$H$ accepts $\langle M\rangle$ iff

iff
$\langle M\rangle \in L$

## $L=\{\langle M\rangle \mid M$ is a TM that accepts $\varepsilon\}$

Theorem: $L \in \mathbf{R E}$.

## $L=\{\langle M\rangle \mid M$ is a TM that accepts $\varepsilon\}$

Theorem: $L \in \mathbf{R E}$. Proof: We will prove that $L \leq{ }_{\mathrm{M}} \mathrm{A}_{\mathrm{TM}}$.

## $L=\{\langle M\rangle \mid M$ is a TM that accepts $\varepsilon\}$

Theorem: $L \in \mathbf{R E}$.
Proof: We will prove that $L \leq_{\mathrm{M}} \mathrm{A}_{\mathrm{TM}}$. Since $\mathrm{A}_{\mathrm{TM}} \in \mathbf{R E}$, this proves $L \in \mathbf{R E}$ as well.

## $L=\{\langle M\rangle \mid M$ is a TM that accepts $\varepsilon\}$

Theorem: $L \in \mathbf{R E}$.
Proof: We will prove that $L \leq_{\mathrm{M}} \mathrm{A}_{\mathrm{TM}}$. Since $\mathrm{A}_{\mathrm{TM}} \in \mathbf{R E}$, this proves $L \in \mathbf{R E}$ as well.

To prove this, we will give a mapping reduction from $L$ to $\mathrm{A}_{\mathrm{TM}}$.

$$
L=\{\langle M\rangle \mid M \text { is a TM that accepts } \varepsilon\}
$$

Theorem: $L \in$ RE.
Proof: We will prove that $L \leq_{\mathrm{M}} \mathrm{A}_{\mathrm{TM}}$. Since $\mathrm{A}_{\mathrm{TM}} \in \mathbf{R E}$, this proves $L \in \mathbf{R E}$ as well.

To prove this, we will give a mapping reduction from $L$ to $\mathrm{A}_{\mathrm{TM}}$. For any TM $M$, let $f(\langle M\rangle)=\langle M, \varepsilon\rangle$. This function can be computed by a Turing machine.

## $L=\{\langle M\rangle \mid M$ is a TM that accepts $\varepsilon\}$

Theorem: $L \in \mathbf{R E}$.
Proof: We will prove that $L \leq_{\mathrm{M}} \mathrm{A}_{\mathrm{TM}}$. Since $\mathrm{A}_{\mathrm{TM}} \in \mathbf{R E}$, this proves $L \in \mathbf{R E}$ as well.

To prove this, we will give a mapping reduction from $L$ to $\mathrm{A}_{\mathrm{TM}}$. For any TM $M$, let $f(\langle M\rangle)=\langle M, \varepsilon\rangle$. This function can be computed by a Turing machine.
Now, we will prove that $f$ is a mapping reduction by proving for all TMs $M$ that $\langle M\rangle \in L$ iff $\langle M, \varepsilon\rangle \in \mathrm{A}_{\mathrm{TM}}$.

$$
L=\{\langle M\rangle \mid M \text { is a TM that accepts } \varepsilon\}
$$

Theorem: $L \in \mathbf{R E}$.
Proof: We will prove that $L \leq_{\mathrm{M}} \mathrm{A}_{\mathrm{TM}}$. Since $\mathrm{A}_{\mathrm{TM}} \in \mathbf{R E}$, this proves $L \in \mathbf{R E}$ as well.

To prove this, we will give a mapping reduction from $L$ to $\mathrm{A}_{\mathrm{TM}}$. For any TM $M$, let $f(\langle M\rangle)=\langle M, \varepsilon\rangle$. This function can be computed by a Turing machine.
Now, we will prove that $f$ is a mapping reduction by proving for all TMs $M$ that $\langle M\rangle \in L$ iff $\langle M, \varepsilon\rangle \in \mathrm{A}_{\mathrm{TM}}$. To do this, consider any TM $M$.

$$
L=\{\langle M\rangle \mid M \text { is a TM that accepts } \varepsilon\}
$$

Theorem: $L \in \mathbf{R E}$.
Proof: We will prove that $L \leq_{\mathrm{M}} \mathrm{A}_{\mathrm{TM}}$. Since $\mathrm{A}_{\mathrm{TM}} \in \mathbf{R E}$, this proves $L \in \mathbf{R E}$ as well.

To prove this, we will give a mapping reduction from $L$ to $\mathrm{A}_{\mathrm{TM}}$. For any TM $M$, let $f(\langle M\rangle)=\langle M, \varepsilon\rangle$. This function can be computed by a Turing machine.

Now, we will prove that $f$ is a mapping reduction by proving for all TMs $M$ that $\langle M\rangle \in L$ iff $\langle M, \varepsilon\rangle \in \mathrm{A}_{\mathrm{TM}}$. To do this, consider any TM M. Note that by the definition of $L$, we see $\langle M\rangle \in L$ iff $M$ accepts $\varepsilon$.

$$
L=\{\langle M\rangle \mid M \text { is a TM that accepts } \varepsilon\}
$$

Theorem: $L \in \mathbf{R E}$.
Proof: We will prove that $L \leq_{\mathrm{M}} \mathrm{A}_{\mathrm{TM}}$. Since $\mathrm{A}_{\mathrm{TM}} \in \mathbf{R E}$, this proves $L \in \mathbf{R E}$ as well.

To prove this, we will give a mapping reduction from $L$ to $\mathrm{A}_{\mathrm{TM}}$. For any TM $M$, let $f(\langle M\rangle)=\langle M, \varepsilon\rangle$. This function can be computed by a Turing machine.

Now, we will prove that $f$ is a mapping reduction by proving for all TMs $M$ that $\langle M\rangle \in L$ iff $\langle M, \varepsilon\rangle \in \mathrm{A}_{\mathrm{TM}}$. To do this, consider any TM M. Note that by the definition of $L$, we see $\langle M\rangle \in L$ iff $M$ accepts $\varepsilon$. By the definition of $\mathrm{A}_{\mathrm{TM}}$, we know that $M$ accepts $\varepsilon$ iff $\langle M, \varepsilon\rangle \in \mathrm{A}_{\mathrm{TM}}$.

$$
L=\{\langle M\rangle \mid M \text { is a TM that accepts } \varepsilon\}
$$

Theorem: $L \in \mathbf{R E}$.
Proof: We will prove that $L \leq_{\mathrm{M}} \mathrm{A}_{\mathrm{TM}}$. Since $\mathrm{A}_{\mathrm{TM}} \in \mathbf{R E}$, this proves $L \in \mathbf{R E}$ as well.

To prove this, we will give a mapping reduction from $L$ to $\mathrm{A}_{\mathrm{TM}}$. For any TM $M$, let $f(\langle M\rangle)=\langle M, \varepsilon\rangle$. This function can be computed by a Turing machine.

Now, we will prove that $f$ is a mapping reduction by proving for all TMs $M$ that $\langle M\rangle \in L$ iff $\langle M, \varepsilon\rangle \in \mathrm{A}_{\mathrm{TM}}$. To do this, consider any TM M. Note that by the definition of $L$, we see $\langle M\rangle \in L$ iff $M$ accepts $\varepsilon$. By the definition of $\mathrm{A}_{\mathrm{TM}}$, we know that $M$ accepts $\varepsilon$ iff $\langle M, \varepsilon\rangle \in \mathrm{A}_{\mathrm{TM}}$. Combining these statements together, we have that $\langle M\rangle \in L$ iff $\langle M, \varepsilon\rangle \in \mathrm{A}_{\mathrm{TM}}$.

$$
L=\{\langle M\rangle \mid M \text { is a TM that accepts } \varepsilon\}
$$

Theorem: $L \in \mathbf{R E}$.
Proof: We will prove that $L \leq_{\mathrm{M}} \mathrm{A}_{\mathrm{TM}}$. Since $\mathrm{A}_{\mathrm{TM}} \in \mathbf{R E}$, this proves $L \in \mathbf{R E}$ as well.

To prove this, we will give a mapping reduction from $L$ to $\mathrm{A}_{\mathrm{TM}}$. For any TM $M$, let $f(\langle M\rangle)=\langle M, \varepsilon\rangle$. This function can be computed by a Turing machine.

Now, we will prove that $f$ is a mapping reduction by proving for all TMs $M$ that $\langle M\rangle \in L$ iff $\langle M, \varepsilon\rangle \in \mathrm{A}_{\mathrm{TM}}$. To do this, consider any TM M. Note that by the definition of $L$, we see $\langle M\rangle \in L$ iff $M$ accepts $\varepsilon$. By the definition of $\mathrm{A}_{\mathrm{TM}}$, we know that $M$ accepts $\varepsilon$ iff $\langle M, \varepsilon\rangle \in \mathrm{A}_{\mathrm{TM}}$. Combining these statements together, we have that $\langle M\rangle \in L$ iff $\langle M, \varepsilon\rangle \in \mathrm{A}_{\mathrm{TM}}$.

This means that $f$ is a mapping reduction from $L$ to $\mathrm{A}_{\mathrm{TM}}$, so $L \leq_{\mathrm{M}} \mathrm{A}_{\mathrm{TM}}$, as required.

$$
L=\{\langle M\rangle \mid M \text { is a TM that accepts } \varepsilon\}
$$

Theorem: $L \in \mathbf{R E}$.
Proof: We will prove that $L \leq_{\mathrm{M}} \mathrm{A}_{\mathrm{TM}}$. Since $\mathrm{A}_{\mathrm{TM}} \in \mathbf{R E}$, this proves $L \in \mathbf{R E}$ as well.

To prove this, we will give a mapping reduction from $L$ to $\mathrm{A}_{\mathrm{TM}}$. For any TM $M$, let $f(\langle M\rangle)=\langle M, \varepsilon\rangle$. This function can be computed by a Turing machine.

Now, we will prove that $f$ is a mapping reduction by proving for all TMs $M$ that $\langle M\rangle \in L$ iff $\langle M, \varepsilon\rangle \in \mathrm{A}_{\mathrm{TM}}$. To do this, consider any TM M. Note that by the definition of $L$, we see $\langle M\rangle \in L$ iff $M$ accepts $\varepsilon$. By the definition of $\mathrm{A}_{\mathrm{TM}}$, we know that $M$ accepts $\varepsilon$ iff $\langle M, \varepsilon\rangle \in \mathrm{A}_{\mathrm{TM}}$. Combining these statements together, we have that $\langle M\rangle \in L$ iff $\langle M, \varepsilon\rangle \in \mathrm{A}_{\mathrm{TM}}$.

This means that $f$ is a mapping reduction from $L$ to $\mathrm{A}_{\mathrm{TM}}$, so $L \leq_{\mathrm{M}} \mathrm{A}_{\mathrm{TM}}$, as required.

## What Did We Prove?

- YES

Machine $H$

## $H=$ "On input $\langle M\rangle$ :

- Run machine $R$ on $\langle M, \varepsilon\rangle$.
- If $R$ accepts $\langle M, \varepsilon\rangle$, then $H$ accepts $w$.
- If $R$ rejects $\langle M, \varepsilon\rangle$, then $H$ rejects $w . "$
$H$ accepts $\langle M\rangle$ iff

iff
$\langle M\rangle \in L$

## What Did We Prove?

## $H=$ "On input $\langle M\rangle$ :

- Run machine $R$ on $\langle M, \varepsilon\rangle$.
- If $R$ accepts $\langle M, \varepsilon\rangle$, then $H$ accepts $w$.
- If $R$ rejects $\langle M, \varepsilon\rangle$, then $H$ rejects $w$.

Machine H

## $H$ accepts $\langle M\rangle$

iff
$\langle M\rangle \in L$

## Interpreting Mapping Reductions

- If $A \leq_{\mathrm{M}} B$, there is a known construction to turn a TM for $B$ into a TM for $A$.
- When doing proofs with mapping reductions, you do not need to show the overall construction.
- You just need to prove that
- $f$ is a computable function, and
- $w \in A$ iff $f(w) \in B$.

## Another Mapping Reduction

## $L_{\mathrm{D}}$ and $\overline{\mathrm{A}}_{\mathrm{TM}}$

- Earlier, we proved $\overline{\mathrm{A}}_{\mathrm{TM}} \notin \mathbf{R E}$ by proving that

$$
\text { If } \overline{\mathrm{A}}_{\mathrm{TM}} \in \mathbf{R E} \text {, then } L_{\mathrm{D}} \in \mathbf{R E} .
$$

- The proof constructed this TM, assuming $R$ was a recognizer for $\overline{\mathrm{A}}_{\mathrm{TM}}$.
$H=$ "On input $\langle M\rangle$ :
- Construct the string $\langle M,\langle M\rangle\rangle$.
- Run $R$ on $\langle M,\langle M\rangle\rangle$.
- If $R$ accepts $\langle M,\langle M\rangle\rangle$, then $H$ accepts $\langle M\rangle$.
- If $R$ rejects $\langle M,\langle M\rangle\rangle$, then $H$ rejects $\langle M\rangle$."
- Let's do another proof using mapping reductions.

$$
L_{\mathrm{D}} \leq_{\mathrm{M}} \overline{\mathrm{~A}}_{\mathrm{TM}}
$$

- To prove that $\overline{\mathrm{A}}_{\mathrm{TM}} \notin \mathbf{R E}$, we will prove

$$
L_{\mathrm{D}} \leq_{\mathrm{M}} \overline{\mathbf{A}}_{\mathrm{TM}}
$$

- By our earlier theorem, since $L_{\mathrm{D}} \notin \mathbf{R E}$, we have that $\overline{\mathrm{A}}_{\mathrm{TM}} \notin \mathbf{R E}$.
- Intuitively: $\overline{\mathrm{A}}_{\mathrm{TM}}$ is "at least as hard" as $L_{\mathrm{D}}$, and since $L_{\mathrm{D}} \notin \mathbf{R E}$, this means $\overline{\mathrm{A}}_{\mathrm{TM}} \notin \mathbf{R E}$.

## $L_{D} \leq_{M} \bar{A}_{T M}$

- Goal: Find a computable function $f$ such that

$$
\langle M\rangle \in L_{\mathrm{D}} \quad \text { iff } \quad f(\langle M\rangle) \in \overline{\mathrm{A}}_{\mathrm{TM}}
$$

- Simplifying this using the definition of $L_{D}$
$M$ does not accept $\langle M\rangle \quad$ iff $\quad f(\langle M\rangle) \in \bar{A}_{\text {TM }}$
- Let's assume that $f(\langle M\rangle)$ has the form $\langle N, w\rangle$ for some TM $N$ and string $w$. This means that
$M$ does not accept $\langle M\rangle \quad$ iff $\quad\langle N, w\rangle \in \overline{\mathbf{A}}_{\text {тм }}$
$M$ does not accept $\langle M\rangle \quad$ iff $\quad N$ does not accept $\boldsymbol{w}$
- If we can choose $w$ and $N$ such that the above is true, we will have our reduction from $L_{\mathrm{D}}$ to $\overline{\mathrm{A}}_{\mathrm{TM}}$.
- Choose $\boldsymbol{N}=\boldsymbol{M}$ and $\boldsymbol{w}=\langle\boldsymbol{M}\rangle$.

- If $R$ rejects $\langle M,\langle M\rangle\rangle$, then H rejects w."
$H$ accepts 〈M〉

Theorem: $\overline{\mathrm{A}}_{\mathrm{TM}} \notin \mathbf{R E}$.
Proof: We will prove that $L_{\mathrm{D}} \leq_{\mathrm{M}} \overline{\mathrm{A}}_{\mathrm{TM}}$. Since $L_{\mathrm{D}} \notin \mathbf{R E}$, this proves that $\overline{\mathrm{A}}_{\mathrm{TM}} \notin \mathbf{R E}$.
To show that $L_{\mathrm{D}} \leq_{\mathrm{M}} \overline{\mathrm{A}}_{\mathrm{TM}}$, we will give a mapping reduction from $L_{\mathrm{D}}$ to $\overline{\mathrm{A}}_{\mathrm{TM}}$. For any TM $M$, let $f(\langle M\rangle)=\langle M,\langle M\rangle\rangle$. This function $f$ is computable.
To prove that $f$ is a mapping reduction from $L_{\mathrm{D}}$ to $\overline{\mathrm{A}}_{\mathrm{TM}}$, we will prove for all TMs $M$ that $\langle M\rangle \in L_{\mathrm{D}}$ iff $\langle M,\langle M\rangle\rangle \in \overline{\mathrm{A}}_{\mathrm{TM}}$. By the definition of $L_{\mathrm{D}}$, we know $\langle M\rangle \in L_{\mathrm{D}}$ iff $M$ does not accept $\langle M\rangle$. Similarly, by definition of $\overline{\mathrm{A}}_{\mathrm{TM}}$, we know that $M$ does not accept $\langle M\rangle$ iff $\langle M,\langle M\rangle\rangle \in \overline{\mathrm{A}}_{\mathrm{TM}}$. Combining these statements together, we see $\langle M\rangle \in L_{\mathrm{D}}$ iff $\langle M,\langle M\rangle\rangle \in \overline{\mathrm{A}}_{\mathrm{TM}}$. Thus $f$ is a mapping reduction from $L_{\mathrm{D}}$ to $\overline{\mathrm{A}}_{\mathrm{TM}}$, so $L_{\mathrm{D}} \leq \overline{\mathrm{A}}_{\mathrm{TM}}$, as required.

## The Amplifier Machine

## TMs in TMs

- As we've seen, Turing machines can run other Turing machines as subroutines.
- In order to reduce certain problems to one another, it is useful / necessary to embed Turing machines inside of one another.
- We'll see an example in a second.
- One construction, in particular, is useful for reductions like these.

## The Amplifier Machine

For any $\mathrm{TM} M$ and string $w$, let $\operatorname{Amp}(M, w)$ be this TM:
$\operatorname{Amp}(M, w)=" O n$ input $x$ :
Ignore $x$.
Run $M$ on $w$.
If $M$ accepts $w$, then $\operatorname{Amp}(M, w)$ accepts $x$. If $M$ rejects $w$, then $\operatorname{Amp}(M, w)$ rejects $x$."

## The Amplifier Machine

For any TM $M$ and string $w$, let $\operatorname{Amp}(M, w)$ be this TM: $\operatorname{Amp}(M, w)=" O n$ input $x$ :

Ignore $x$.
Run $M$ on $w$.
If $M$ accepts $w$, then $\operatorname{Amp}(M, w)$ accepts $x$. If $M$ rejects $w$, then $\operatorname{Amp}(M, w)$ rejects $x$."

## The Amplifier Machine

For any TM $M$ and string $w$, let $\operatorname{Amp}(M, w)$ be this TM:
$\operatorname{Amp}(M, w)="$ On input $x:$
Ignore $x$.
Run $M$ on $w$.
If $M$ accepts $w$, then $\operatorname{Amp}(M, w)$ accepts $\chi$.
If $M$ rejects $w$, then $\operatorname{Amp}(M, w)$ rejects $x$."
Theorem 1: If $M$ accepts $w$, then $\mathscr{L}(\operatorname{Amp}(M, w))=\Sigma^{*}$. If $M$ does not accept $w$, then $\mathscr{L}(\operatorname{Amp}(M, w))=\varnothing$.

Corollary 1: $M$ accepts $w$ iff $\mathscr{L}(\operatorname{Amp}(M, w))=\Sigma^{*}$
Corollary 2: $M$ does not accept $w$ iff $\mathscr{L}(\operatorname{Amp}(M, w))=\varnothing$.

For any TM $M$ and string $w$, let $\operatorname{Amp}(M, w)$ be the following TM:
$\operatorname{Amp}(M, w)="$ On input $x:$
Ignore $x$.
Run $M$ on $w$.
If $M$ accepts $w$, then $\operatorname{Amp}(M, w)$ accepts $x$.
If $M$ rejects $w$, then $\operatorname{Amp}(M, w)$ rejects $x$."
Theorem: If $M$ accepts $w$, then $\mathscr{L}(\operatorname{Amp}(M, w))=\Sigma^{*}$. If $M$ does not accept $w$, then $\mathscr{L}(\operatorname{Amp}(M, w))=\varnothing$.

Proof: First, we consider what happens if $M$ accepts $w$. In this case, consider what happens when we run $\operatorname{Amp}(M, w)$ on an arbitrary input string $x . \operatorname{Amp}(M, w)$ will run $M$ on $w$, and since $M$ accepts $w, \operatorname{Amp}(M, w)$ accepts $x$. Since our choice of $x$ was arbitrary, we see that $\operatorname{Amp}(M, w)$ accepts any input, so $\mathscr{L}(\operatorname{Amp}(M, w))=\Sigma^{*}$.

Otherwise, $M$ does not accept $w$, so $M$ rejects $w$ or $M$ loops on $w$. Consider the result of running $\operatorname{Amp}(M, w)$ on an arbitrary string $x$. If $M$ rejects $w$, then $\operatorname{Amp}(M, w)$ rejects $x$. Otherwise, $\operatorname{Amp}(M, w)$ loops on $x$. In both cases, $\operatorname{Amp}(M, w)$ doesn't accept $x$. Since our choice of $x$ was arbitrary, we see that $\operatorname{Amp}(M, w)$ never accepts any input, so $\mathscr{L}(\operatorname{Amp}(M, w))=\varnothing$. $\square$

## The Amplifier Machine

For any TM $M$ and string $w$, let $\operatorname{Amp}(M, w)$ be this TM:
$\operatorname{Amp}(M, w)="$ On input $x:$
Ignore $x$.
Run $M$ on $w$.
If $M$ accepts $w$, then $\operatorname{Amp}(M, w)$ accepts $x$.
If $M$ rejects $w$, then $\operatorname{Amp}(M, w)$ rejects $x$."
Theorem 1: If $M$ accepts $w$, then $\mathscr{L}(\operatorname{Amp}(M, w))=\Sigma^{*}$. If $M$ does not accept $w$, then $\mathscr{L}(\operatorname{Amp}(M, w))=\varnothing$.

Corollary 1: $M$ accepts $w$ iff $\mathscr{L}(\operatorname{Amp}(M, w))=\Sigma^{*}$
Corollary 2: $M$ does not accept $w$ iff $\mathscr{L}(\operatorname{Amp}(M, w))=\varnothing$.
Theorem 2: The function $f(\langle M, w\rangle)=\langle\operatorname{Amp}(M, w)\rangle$ is computable.

"On input $x$ :

## Using the Amplifier

## A More Elaborate Reduction

- Since $\overline{\mathrm{A}}_{\mathrm{TM}} \notin \mathbf{R E}$, there is no algorithm for determining whether a TM will not accept a given string.
- Could we check instead whether a TM never accepts a string?
- Consider the language

$$
L_{\mathrm{e}}=\{\langle M\rangle \mid M \text { is a } T M \text { and } \mathscr{L}(M)=\varnothing\}
$$

- How "hard" is $L_{\mathrm{e}}$ ? Is it $\mathbf{R}, \mathbf{R E}$, co-RE, or none of these?

## Building an Intuition

- Before we even try to prove how "hard" this language is, we should build an intuition for its difficulty.
- $L_{\mathrm{e}}$ is probably not in $\mathbf{R E}$, since if we were convinced a TM never accepted, it would be hard to find positive evidence of this.
- $L_{\mathrm{e}}$ is probably in co-RE, since if we were convinced that a TM did accept some string, we could exhaustively search over all strings and try to find the string it accepts.
- Best guess: $L_{\mathrm{e}} \in \operatorname{co}-\mathbf{R E}-\mathbf{R}$.

## $\overline{\mathrm{A}}_{\mathrm{TM}} \leq_{\mathrm{M}} L_{\mathrm{e}}$

- We will prove that $L_{\mathrm{e}} \notin \mathbf{R E}$ by showing that $\overline{\mathrm{A}}_{\mathrm{TM}} \leq_{\mathrm{M}} L_{\mathrm{e}}$. (This also proves $L_{\mathrm{e}} \notin \mathbf{R}$ ).
- We want to find a function $f$ such that

$$
\langle M, w\rangle \in \overline{\mathbf{A}}_{\mathrm{TM}} \quad \text { iff } \quad f(\langle M, w\rangle) \in \mathbf{L}_{\mathrm{e}}
$$

- Since $L_{\mathrm{e}}$ is a language of TM descriptions, let's assume $f(\langle M, w\rangle)=\langle N\rangle$ for some TM $N$. Then

$$
\langle M, w\rangle \in \overline{\mathbf{A}}_{\mathrm{TM}} \quad \text { iff } \quad\langle N\rangle \in L_{\mathrm{e}}
$$

- Expanding out definitions, we get
$M$ doesn't accept $\boldsymbol{w}$ iff $\mathscr{L}(\mathbf{N})=\varnothing$
- How do we pick the machine $N$ ?

## The Reduction

- Choose $N$ such that this holds:

## $M$ doesn't accept $\boldsymbol{w}$ iff $\mathscr{L}(\mathbf{N})=\boldsymbol{\varnothing}$

- We can pick $N=\operatorname{Amp}(M, w)$.
- Recall: $\mathscr{L}(\operatorname{Amp}(M, w))=\varnothing$ iff $M$ doesn't accept $w$.
- Since $f(\langle M, w\rangle)=\langle\operatorname{Amp}(M, w)\rangle$ is computable, this is the mapping reduction we need!

Theorem: $L_{\mathrm{e}} \notin \mathbf{R E}$
Proof: We will prove $\overline{\mathrm{A}}_{\mathrm{TM}} \leq_{\mathrm{M}}$ Le. Since $\overline{\mathrm{A}}_{\mathrm{TM}} \notin \mathbf{R E}$, this proves that $L_{\mathrm{e}} \notin \mathbf{R E}$, as required. To do so, we will exhibit a mapping reduction from $\overline{\mathrm{A}}_{\mathrm{TM}}$ to $L_{\mathrm{e}}$. For any TM/string pair $\langle M, w\rangle$, let $f(\langle M, w\rangle)=\langle\operatorname{Amp}(M, w)\rangle$. By our earlier theorem, this function is computable.

We claim this is a mapping reduction from $\overline{\mathrm{A}}_{\mathrm{TM}}$ to $L_{\mathrm{e}}$. To prove this, we will prove that $\langle M, w\rangle \in \overline{\mathrm{A}}_{\mathrm{TM}}$ iff $\langle\operatorname{Amp}(M, w)\rangle \in L e$. By definition of $\overline{\mathrm{A}}_{\mathrm{TM}}$, we see $\langle M, w\rangle$ iff $M$ does not accept $w$. By our earlier theorem, $M$ does not accept $w$ iff $\mathscr{L}(\operatorname{Amp}(M, w))=\emptyset$. Finally, by definition of $L e$, we see $\mathscr{L}(\operatorname{Amp}(M, w))=\varnothing$ iff $\langle\operatorname{Amp}(M, w)\rangle \in L_{\mathrm{e}}$. Taken together, we see that $\langle M, w\rangle \in \overline{\mathrm{A}}_{\mathrm{TM}}$ iff $\langle\operatorname{Amp}(M, w)\rangle \in L_{e}$, so $f$ is a mapping reduction from $\overline{\mathrm{A}}_{\mathrm{TM}}$ to $L e$. Therefore, we see $\overline{\mathrm{A}}_{\mathrm{TM}} \leq_{\mathrm{M}} \mathrm{Le}_{\mathrm{e}}$, as required.

## A Math Joke

## Time-Out For Announcements

## Problem Set 6 Graded

- On-time Problem Set 6's have all been graded and should be returned after lecture today.
- Online submissions: contact us if you don't hear back soon.
- Late Problem Set 6's will be returned this Wednesday.

## Problem Set 8 Out

- Problem Set 8 goes out right now. It's due the Monday after Thanksgiving break (December 2).
- Some contradictory information:
- This is the last problem set on which you can use a late period.
- We strongly recommend that you don't, since you'll be pinched trying to finish Problem Set 9 if you do.
- TAs and I will figure out an OH schedule during Thanksgiving week.

## Your Questions

"The fact we can't create a TM for $\overline{\mathrm{A}}_{\mathrm{TM}}$ and $L_{\mathrm{D}}$ is very cool. But it is tough to see why we would want to solve those problems in the first place - what are problems that we actually want to solve but can't, because of limits of computability?"
"Aren't there some cases where we can know a TM is infinite looping? Couldn't we modify the $\mathrm{U}_{\mathrm{TM}}$ so it keeps a record of IDs
and then if it sees the same one twice know it was in a loop? This doesn't guarantee to find all loops, but would it be useful?"
"What's the difference between a language being decidable and having a decider for a language?"
"The generalized hailstone sequence terminating is proven to be undecidable (http://link.springer.com/chapter/10.1007\%2F978-3-540-72504-6_49).
What purpose is there to prove something as undecidable? Is undecidable better than not solvable?"

## Back to CS103

## The Limits of Computability

## RE $\cup$ co-RE is Not Everything

- Using the same reasoning as the first day of lecture, we can show that there must be problems that are neither RE nor co-RE.
- There are more sets of strings than TMs.
- There are more sets of strings than twice the number of TMs.
- What do these languages look like?

## TM Equality

- There are infinitely many pairs of Turing machines with the same language as one another.
- Good exercise: think about why this is.
- Consider the following language:

$$
\begin{array}{r}
E Q_{\mathrm{TM}}=\left\{\left\langle M_{1}, M_{2}\right\rangle \mid M_{1} \text { and } M_{2}\right. \text { are TMs } \\
\\
\text { and } \left.\mathscr{L}\left(M_{1}\right)=\mathscr{L}\left(M_{2}\right)\right\}
\end{array}
$$

- Questions:
- Is $\mathrm{EQ}_{\mathrm{TM}} \in$ co-RE?
- Is $\mathrm{EQ}_{\mathrm{TM}} \in \mathbf{R E}$ ?

## Is $\mathrm{EQ}_{\mathrm{TM}} \in$ co-RE?

- Intuitively, would we expect $\mathrm{EQ}_{\mathrm{TM}}$ to be a co-RE language?
- Suppose TM $M_{1}$ accepts a string $w$. We'd need to know whether $M_{2}$ accepts $w$ as well.
- Co-recognizing this would require us to have a corecognizer that detects whether $\left\langle M_{2}, w\right\rangle \in \mathrm{A}_{\mathrm{TM}}$, but that's not an co-RE language!
- Our guess: $E Q_{T M}$ is probably not co-RE.

## Proving $\mathrm{EQ}_{\mathrm{TM}} \notin$ co-RE

- To prove that $\mathrm{EQ}_{\mathrm{TM}} \notin$ co-RE, we can try to find a language $L$ where
- L $\notin$ co-RE, and
- $L \leq_{\mathrm{M}} \mathrm{EQ}_{\mathrm{TM}}$
- A good candidate would be something like $\mathrm{A}_{\mathrm{TM}}$, which is a "canonical" non-co-RE languages.
- Goal: Prove $A_{T M} \leq_{M} \mathrm{EQ}_{\mathrm{TM}}$.

## Proving $A_{T M} \leq_{M} E Q_{T M}$

- Goal: Find a computable function $f$ where

$$
\langle M, w\rangle \in \mathbf{A}_{\mathrm{TM}} \text { iff } f(\langle M, w\rangle) \in E \mathbf{Q}_{\mathrm{TM}}
$$

- Since $E Q_{T M}$ is a language of pairs of TMs, let's assume $f(\langle M\rangle)=\left\langle M_{1}, M_{2}\right\rangle$. Then we want to pick $M_{1}$ and $M_{2}$ such that

$$
\left\langle M_{1}, w\right\rangle \in \mathbf{A}_{\mathrm{TM}} \text { iff }\left\langle M_{1}, M_{2}\right\rangle \in \mathbf{E Q}_{\mathrm{TM}}
$$

- Substituting definitions, we want
$M$ accepts $\boldsymbol{w}$ iff $\mathscr{L}\left(\mathbf{M}_{1}\right)=\mathscr{L}\left(M_{2}\right)$
- What do we do now?

## Using the Amplifier

- We want

## $M$ accepts $\boldsymbol{w}$ iff $\mathscr{L}\left(\mathbf{M}_{1}\right)=\mathscr{L}\left(\mathbf{M}_{2}\right)$

- What happens if we pick $M_{1}$ to be $\operatorname{Amp}(M, w) ?$
- If $M$ accepts $w$, then $\mathscr{L}\left(M_{1}\right)=\Sigma^{*}$.
- If $M$ does not accept $w$, then $\mathscr{L}\left(M_{1}\right)=\varnothing$.
- Choose $M_{1}$ to be the amplifier machine and $M_{2}$ to be any TM with language $\Sigma^{*}$. Then the above statement is true!

## What's Going On?

- Suppose we have an oracle for $E Q_{T M}$.
- We want to know whether $M$ accepts $w$.
- To do this:
- Find a TM $S$ we know has language $\Sigma^{*}$.
- Ask the oracle "does TM $\operatorname{Amp}(M, w)$ have the same language as TM S?"
- If so, then $M$ accepts $w$.
- If not, then $M$ does not accept $w$.

## Theorem: $\mathrm{EQ}_{\mathrm{TM}} \notin$ co-RE.

Proof: We will prove $\mathrm{A}_{\mathrm{TM}} \leq_{\mathrm{M}} \mathrm{EQ}_{\mathrm{TM}}$. Since $\mathrm{A}_{\mathrm{TM}} \notin$ co-RE, this proves that $\mathrm{EQ}_{\mathrm{TM}} \notin$ co-RE. To show $\mathrm{A}_{\mathrm{TM}} \leq_{\mathrm{M}} \mathrm{EQ}_{\mathrm{TM}}$, we will exhibit a mapping reduction from $\mathrm{A}_{\mathrm{TM}}$ to $\mathrm{EQ}_{\mathrm{TM}}$.

For any TM/string pair $\langle M, w\rangle$, define $f(\langle M, w\rangle)$ to be the pair of TMs $\langle\operatorname{Amp}(M, w), S\rangle$, where $S$ is the TM "On input $x$, accept $x$." This function is computable, and note that $\mathscr{L}(S)=\Sigma^{*}$.
We claim that $\langle M, w\rangle \in \mathrm{A}_{\text {TM }}$ iff $\langle\operatorname{Amp}(M, w), E\rangle \in \mathrm{EQ}_{\text {TM }}$. To see this, note by definition of $\mathrm{A}_{\mathrm{TM}}$ that $\langle M, w\rangle \in \mathrm{A}_{\mathrm{TM}}$ iff $M$ accepts $w$. By our earlier theorem, $M$ accepts $w$ iff $\mathscr{L}(\operatorname{Amp}(M, w))=\Sigma^{*}$. Since $\mathscr{L}(S)=\Sigma^{*}$, we see $M$ accepts $w$ iff $\mathscr{L}(\operatorname{Amp}(M, w))=\mathscr{L}(S)$. Finally, by definition of $\mathrm{EQ}_{\mathrm{TM}}$, $\mathscr{L}(\operatorname{Amp}(M, w))=\mathscr{L}(S)$ iff $\langle\operatorname{Amp}(M, w), S\rangle \in \mathrm{EQ}_{\mathrm{TM}}$. Collectively, we see $\langle M, w\rangle \in \mathrm{A}_{\mathrm{TM}}$ iff $\langle\operatorname{Amp}(M, w), S\rangle \in \mathrm{EQ}_{\mathrm{TM}}$. Thus $f$ is a mapping reduction from $\mathrm{A}_{\mathrm{TM}}$ to $\mathrm{EQ}_{\mathrm{TM}}$, so $\mathrm{A}_{\mathrm{TM}} \leq_{\mathrm{M}} \mathrm{EQ}_{\mathrm{TM}}$, as required.

## Is $\mathrm{EQ}_{\mathrm{TM}} \in \mathbf{R E}$ ?

- Intuitively, would we expect $\mathrm{EQ}_{\mathrm{TM}}$ to be a RE language?
- Suppose TM $M_{1}$ doesn't accept a string $w$. We'd need to know whether $M_{2}$ also doesn't accept $w$.
- Recognizing this would require us to have a recognizer that detects whether $\left\langle M_{2}, w\right\rangle \in \overline{\mathrm{A}}_{\mathrm{TM}}$, but that's not an $\mathbf{R E}$ language!
- Our guess: $E Q_{T M}$ is probably not $\boldsymbol{R E}$.

## Proving $\overline{\mathrm{A}}_{\mathrm{TM}} \leq_{\mathrm{M}} \mathrm{EQ}_{\mathrm{TM}}$

- Goal: Find a computable function $f$ where

$$
\langle M, w\rangle \in \overline{\mathrm{A}}_{\mathrm{TM}} \text { iff } f(\langle M, w\rangle) \in \mathrm{EQ}_{\mathrm{TM}}
$$

- Since $E Q_{T M}$ is a language of pairs of TMs, let's assume $f(\langle M\rangle)=\left\langle M_{1}, M_{2}\right\rangle$. Then we want to pick $M_{1}$ and $M_{2}$ such that

$$
\langle M, w\rangle \in \overline{\mathbf{A}}_{\mathrm{TM}} \text { iff }\left\langle M_{1}, M_{2}\right\rangle \in E \mathbf{Q}_{\mathrm{TM}}
$$

- Substituting definitions, we want
$M$ does not accept $\boldsymbol{w}$ iff $\mathscr{L}\left(M_{1}\right)=\mathscr{L}\left(M_{2}\right)$
- What do we do now?

## Using the Amplifier

- We want
$M$ does not accept $\boldsymbol{w}$ iff $\mathscr{L}\left(M_{1}\right)=\mathscr{L}\left(M_{2}\right)$
- What happens if we pick $M_{1}$ to be $\operatorname{Amp}(M, w) ?$
- If $M$ accepts $w$, then $\mathscr{L}\left(M_{1}\right)=\Sigma^{*}$.
- If $M$ does not accept $w$, then $\mathscr{L}\left(M_{1}\right)=\varnothing$.
- Choose $M_{1}$ to be the amplifier machine and $M_{2}$ to be any TM with language $\varnothing$. Then the above statement is true!

## What's Going On?

- Suppose we have an oracle for $E Q_{T M}$.
- We want to know whether $M$ accepts $w$.
- To do this:
- Find a TM $E$ we know has language $\varnothing$.
- Ask the oracle "does TM $\operatorname{Amp}(M, w)$ have the same language as TM E?"
- If so, then $M$ does not accept $w$.
- If not, then $M$ accepts $w$.

## Theorem: $\mathrm{EQ}_{\mathrm{TM}} \notin \mathbf{R E}$.

Proof: We will prove $\overline{\mathrm{A}}_{\mathrm{TM}} \leq_{\mathrm{M}} \mathrm{EQ}_{\mathrm{TM}}$. Since $\overline{\mathrm{A}}_{\mathrm{TM}} \notin \mathbf{R E}$, this proves that $\mathrm{EQ}_{\mathrm{TM}} \notin \mathbf{R E}$. To show $\overline{\mathrm{A}}_{\mathrm{TM}} \leq_{\mathrm{M}} \mathrm{EQ}_{\mathrm{TM}}$, we will exhibit a mapping reduction from $\overline{\mathrm{A}}_{\mathrm{TM}}$ to $\mathrm{EQ}_{\mathrm{TM}}$.

For any TM/string pair $\langle M, w\rangle$, define $f(\langle M, w\rangle)$ to be the pair of TMs $\langle\operatorname{Amp}(M, w), E\rangle$, where $E$ is the TM "On input $x$, reject $x$." This function is computable, and note that $\mathscr{L}(E)=\varnothing$.
We claim that $\langle M, w\rangle \in \overline{\mathrm{A}}_{\mathrm{TM}} \operatorname{iff}\langle\operatorname{Amp}(M, w), E\rangle \in \mathrm{EQ}_{\mathrm{TM}}$. To see this, note by definition of $\overline{\mathrm{A}}_{\mathrm{TM}}$ that $\langle M, w\rangle \in \overline{\mathrm{A}}_{\mathrm{TM}}$ iff $M$ does not accept $w$. By our theorem, $M$ does not accept $w$ iff $\mathscr{L}(\operatorname{Amp}(M, w))=\varnothing$. Since $\mathscr{L}(E)=\varnothing$, we see $M$ does not accept $w$ iff $\mathscr{L}(\operatorname{Amp}(M, w))=\mathscr{L}(E)$. Finally, by definition of $\mathrm{EQ}_{\mathrm{TM}} \mathscr{L}(\operatorname{Amp}(M, w))=\mathscr{L}(E)$ iff $\langle\operatorname{Amp}(M, w), E\rangle \in \mathrm{EQ}_{\mathrm{TM}}$. Collectively, we see $\langle M, w\rangle \in \overline{\mathrm{A}}_{\mathrm{TM}}$ iff $\langle\operatorname{Amp}(M, w), E\rangle \in \mathrm{EQ}_{\mathrm{TM}}$. Thus $f$ is a mapping reduction from $\overline{\mathrm{A}}_{\mathrm{TM}}$ to $\mathrm{EQ}_{\mathrm{TM}}$, so $\overline{\mathrm{A}}_{\mathrm{TM}} \leq_{\mathrm{M}} \mathrm{EQ}_{\mathrm{TM}^{\prime}}$, as required.
