## NP-Completeness Part II

## Recap from Last Time

## NP-Hardness

- A language $L$ is called NP-hard iff for every $L^{\prime} \in \mathbf{N P}$, we have $L^{\prime} \leq_{\mathrm{p}} L$.
- A language in $L$ is called NP-complete iff $L$ is NP-hard and $L \in \mathbf{N P}$.
- The class NPC is the set of NP-complete problems.

## The Tantalizing Truth

Theorem: If any NP-complete language is in $\mathbf{P}$, then $\mathbf{P}=\mathbf{N P}$.
Proof: If $L \in \mathbf{N P C}$ and $L \in \mathbf{P}$, we know for any $L^{\prime} \in \mathbf{N P}$ that $L^{\prime} \leq_{\mathrm{p}} L$, because $L$ is NP-complete. Since $L^{\prime} \leq_{\mathrm{P}} L$ and $L \in \mathbf{P}$, this means that $L^{\prime} \in \mathbf{P}$ as well. Since our choice of $L^{\prime}$ was arbitrary, any language $L^{\prime} \in \mathbf{N P}$ satisfies $L^{\prime} \in \mathbf{P}$, so $\mathbf{N P} \subseteq \mathbf{P}$. Since $\mathbf{P} \subseteq \mathbf{N P}$, this means $\mathbf{P}=\mathbf{N P}$.

## The Tantalizing Truth

Theorem: If any NP-complete language is in $\mathbf{P}$, then $\mathbf{P}=\mathbf{N P}$.
Proof: If $L \in \mathbf{N P C}$ and $L \in \mathbf{P}$, we know for any $L^{\prime} \in \mathbf{N P}$ that $L^{\prime} \leq_{\mathrm{p}} L$, because $L$ is NP-complete. Since $L^{\prime} \leq_{\mathrm{P}} L$ and $L \in \mathbf{P}$, this means that $L^{\prime} \in \mathbf{P}$ as well. Since our choice of $L^{\prime}$ was arbitrary, any language $L^{\prime} \in \mathbf{N P}$ satisfies $L^{\prime} \in \mathbf{P}$, so $\mathbf{N P} \subseteq \mathbf{P}$. Since $\mathbf{P} \subseteq \mathbf{N P}$, this means $\mathbf{P}=\mathbf{N P}$.

## The Tantalizing Truth

Theorem: If any NP-complete language is in $\mathbf{P}$, then $\mathbf{P}=\mathbf{N P}$.
Proof: If $L \in \mathbf{N P C}$ and $L \in \mathbf{P}$, we know for any $L^{\prime} \in \mathbf{N P}$ that $L^{\prime} \leq_{\mathrm{p}} L$, because $L$ is NP-complete. Since $L^{\prime} \leq_{\mathrm{P}} L$ and $L \in \mathbf{P}$, this means that $L^{\prime} \in \mathbf{P}$ as well. Since our choice of $L^{\prime}$ was arbitrary, any language $L^{\prime} \in \mathbf{N} \mathbf{P}$ satisfies $L^{\prime} \in \mathbf{P}$, so $\mathbf{N P} \subseteq \mathbf{P}$. Since $\mathbf{P} \subseteq \mathbf{N P}$, this means $\mathbf{P}=\mathbf{N P}$.

## The Tantalizing Truth

Theorem: If any NP-complete language is in $\mathbf{P}$, then $\mathbf{P}=\mathbf{N P}$.
Proof: If $L \in \mathbf{N P C}$ and $L \in \mathbf{P}$, we know for any $L^{\prime} \in \mathbf{N P}$ that $L^{\prime} \leq_{\mathrm{p}} L$, because $L$ is NP-complete. Since $L^{\prime} \leq_{\mathrm{P}} L$ and $L \in \mathbf{P}$, this means that $L^{\prime} \in \mathbf{P}$ as well. Since our choice of $L^{\prime}$ was arbitrary, any language $L^{\prime} \in \mathbf{N P}$ satisfies $L^{\prime} \in \mathbf{P}$, so $\mathbf{N P} \subseteq \mathbf{P}$. Since $\mathbf{P} \subseteq \mathbf{N P}$, this means $\mathbf{P}=\mathbf{N P} . \square$

## The Tantalizing Truth

Theorem: If any NP-complete language is not in $\mathbf{P}$, then $\mathbf{P} \neq \mathbf{N P}$.
Proof: If $L \in \mathbf{N P C}$, then $L \in \mathbf{N P}$. Thus if $L \notin \mathbf{P}$, then $L \in \mathbf{N P}-\mathbf{P}$. This means that $\mathbf{N P}-\mathbf{P} \neq \varnothing$, so $\mathbf{P} \neq \mathbf{N P}$.

## Satisfiability

- A propositional logic formula $\varphi$ is called satisfiable if there is some assignment to its variables that makes it evaluate to true.
- $p \wedge q$ is satisfiable.
- $p \wedge \neg p$ is unsatisfiable.
- $p \rightarrow(q \wedge \neg q)$ is satisfiable.
- An assignment of true and false to the variables of $\varphi$ that makes it evaluate to true is called a satisfying assignment.

## Literals and Clauses

- A literal in propositional logic is a variable or its negation:
- $X$
- $\neg y$
- But not $x \wedge y$.
- A clause is a many-way OR (disjunction) of literals.
- $\neg \chi \vee y \vee \neg z$
- $X$
- But not $x \vee \neg(y \vee z)$

## Conjunctive Normal Form

- A propositional logic formula $\varphi$ is in conjunctive normal form (CNF) if it is the many-way AND (conjunction) of clauses.
- ( $x \vee y \vee z) \wedge(\neg x \vee \neg y) \wedge(x \vee y \vee z \vee \neg w)$
- $x \vee z$
- But not $(x \vee(y \wedge z)) \vee(x \vee y)$
- Only legal operators are $\neg, \mathrm{v}, \wedge$.
- No nesting allowed.

## The Structure of CNF

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

Each clause must have at least one
true literal in it.

## The Structure of CNF

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

We should pick at least one true literal from each clause

## The Structure of CNF

$(\underbrace{x \vee y \vee \neg z}) \wedge(\underbrace{\neg x \vee \neg y \vee z}) \wedge(\underbrace{\neg x \vee y \vee \neg z})$
... subject to the constraint
that we never choose a literal and its negation

## 3-CNF

- A propositional formula is in 3-CNF if
- It is in CNF, and
- Every clause has exactly three literals.
- For example:
- ( $x \vee y \vee z) \wedge(\neg x \vee \neg y \vee z)$
- ( $x \vee x \vee x) \wedge(y \vee \neg y \vee \neg x) \wedge(x \vee y \vee \neg y)$
- But not ( $x \vee y \vee z \vee w) \wedge(x \vee y)$
- The language 3SAT is defined as follows:

## 3SAT $=\{\langle\varphi\rangle \mid \varphi$ is a satisfiable 3-CNF formula \}

## Theorem: 3SAT is NP-Complete

## NP-Completeness

Theorem: Let $L_{1}$ and $L_{2}$ be languages. If $L_{1} \leq_{\mathrm{P}} L_{2}$ and $L_{1}$ is NP-hard, then $L_{2}$ is NP-hard.

## NP-Completeness

Theorem: Let $L_{1}$ and $L_{2}$ be languages. If $L_{1} \leq_{\mathrm{P}} L_{2}$ and $L_{1}$ is NP-hard, then $L_{2}$ is NP-hard.

## P

Theorem: Let $L_{1}$ and $L_{2}$ be languages where $L_{1} \in \mathbf{N P C}$ and $L_{2} \in \mathbf{N P}$. If $L_{1} \leq_{\mathrm{p}} L_{2}$, then $L_{2} \in$ NPC.

## NP

P

## Be Careful!

- To prove that some language $L$ is NP-complete, show that $L \in \mathbf{N P}$, then reduce some known NP-complete problem to $L$.
- Do not reduce $L$ to a known NP-complete problem.
- We already knew you could do this; every NP problems is reducible to any NP-complete problem!

## Be Careful!

- Do not reduce $L$ to a known NP-complete problem.
- We already knew you could do this; every NP problems is reducible to any NP-complete problem!

## So what other problems are NP-complete?

An independent set in an undirected graph is a set of vertices that have no edges between them

An independent set in an undirected graph is a set of vertices that have no edges between them

An independent set in an undirected graph is a set of vertices that have no edges between them

An independent set in an undirected graph is a set of vertices that have no edges between them

An independent set in an undirected graph is a set of vertices that have no edges between them

## The Independent Set Problem

- Given an undirected graph $G$ and a natural number $n$, the independent set problem is

## Does $G$ contain an independent set of size at least $n$ ?

- As a formal language:

INDSET $=\{\langle G, n\rangle \mid G$ is an undirected graph with an independent set of size at least $\boldsymbol{n}\}$

## $I N D S E T \in \mathbf{N P}$

- The independent set problem is in NP.
- Here is a polynomial-time verifier that checks whether $S$ is an $n$-element independent set:
- $V=$ "On input $\langle\langle G, n\rangle, S\rangle$ :
- If $|S|<n$, reject.
- For each edge in $G$, if both endpoints are in $S$, reject.
- Otherwise, accept."

## INDSET $\in \mathbf{N P C}$

- The INDSET problem is NP-complete.
- To prove this, we will find a polynomial-time reduction from 3SAT to $I N D S E T$.
- Goal: Given a 3CNF formula $\varphi$, build a graph $G$ and number $n$ such that $\varphi$ is satisfiable iff $G$ has an independent set of size $n$.
- How can we accomplish this?

## The Structure of 3CNF

$$
(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y \text { } \vee \neg z)
$$

## The Structure of 3CNF

$$
(x \vee y \text { v } \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y \text { } \vee \neg z)
$$

The Structure of 3CNF

$$
(x \vee y \quad \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y \vee \neg z)
$$

Each clause must have
at least one true literal in it.

## The Structure of 3CNF

$$
(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)
$$

## The Structure of 3CNF

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

We should pick at least one true literal from each clause

## The Structure of 3CNF

$$
(\underbrace{x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z) ~}
$$

## The Structure of 3CNF

$$
(\underbrace{x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y \vee \neg z) ~}
$$

## The Structure of 3CNF

$$
(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y \vee \neg z)
$$

## The Structure of 3CNF

$(\underbrace{x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y \vee \neg z) ~}$

## The Structure of 3CNF

... subject to the constraint
that we never choose a
literal and its negation

## From 3SAT to INDSET

- To convert a 3SAT instance $\varphi$ to an INDSET instance, we need a graph $G$ and number $n$ such that an independent set of size at least $n$ in $G$
- gives us a way to choose which literal in each clause of $\varphi$ should be true,
- doesn't simultaneously choose a literal and its negation, and
- has size polynomially large in the length of the formula $\varphi$.

## From 3SAT to INDSET

$$
(x \vee y \text { v } \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y \text { } \vee \neg z)
$$

## From 3SAT to INDSET

## From 3SAT to INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

## From 3SAT to INDSET

$(x \vee y v \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

Any independent set in this graph chooses exactly one literal from each clause to be true.

## From 3SAT to INDSET

$(x \vee y v \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

Any independent set in this graph chooses exactly one literal from each clause to be true.

## From 3SAT to INDSET

$(x \vee y v \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

Any independent set in this graph chooses exactly one literal from each clause to be true.

## From 3SAT to INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

Any independent set in this graph chooses exactly one literal from each clause to be true.

## From 3SAT to INDSET

$(x \vee y v \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

Any independent set in this graph chooses exactly one literal from each clause to be true.

## From 3SAT to INDSET

$(\underbrace{x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z) ~}$

Any independent set in this graph chooses exactly one literal from each clause to be true.

## From 3SAT to INDSET

$(x \vee y v \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

Any independent set in this graph chooses exactly one literal from each clause to be true.

## From 3SAT to INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

Any independent set in this graph chooses exactly one literal from each clause to be true.

## From 3SAT to INDSET

$(\underbrace{x \vee y \vee \neg z) \wedge(\underbrace{\sim} \vee \neg y \vee z) \wedge(\neg x \vee y \vee \neg z) ~}$

Any independent set in this graph chooses exactly one literal from each clause to be true.

## From 3SAT to INDSET

We need a way to ensure we never pick a literal and its negation.

## From 3SAT to INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

## From 3SAT to INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

## From 3SAT to INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

## From 3SAT to INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

No independent set in this graph can choose two nodes labeled $\boldsymbol{x}$ and $\boldsymbol{\neg \boldsymbol { x }}$.

## From 3SAT to INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

## From 3SAT to INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

## From 3SAT to INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

## From 3SAT to INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

## From 3SAT to INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

## From 3SAT to INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

## From 3SAT to INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

## From 3SAT to INDSET

$(x \vee y v \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

If this graph has an independent set of size three, the original formula is satisfiable.

## From 3SAT to INDSET

$(x \vee y v \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

If this graph has an independent set of size three, the original formula is satisfiable.

## From 3SAT to INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

If this graph has an independent set of size three, the original formula is satisfiable.

## From 3SAT to INDSET

$$
x=\text { false, } y=\text { false, } z=\text { false. }
$$

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

If this graph has an independent set of size three, the original formula is satisfiable.

## From 3SAT to INDSET

$(x \vee y v \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

If this graph has an independent set of size three, the original formula is satisfiable.

## From 3SAT to INDSET

If this graph has an independent set of size three, the original formula is satisfiable.

## From 3SAT to INDSET

$$
x=\operatorname{true}, y=\text { true, } z=\text { true. }
$$

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y \vee \neg z)$

If this graph has an independent set of size three, the original formula is satisfiable.

## From 3SAT to INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

If this graph has an independent set of size three, the original formula is satisfiable.

## From 3SAT to INDSET

$(\underbrace{x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z) ~}$

If this graph has an independent set of size three, the original formula is satisfiable.

## From 3SAT to INDSET

$$
x=\text { false, } y=? ?, z=\text { false }
$$

If this graph has an independent set of size three, the original formula is satisfiable.

## From 3SAT to INDSET

$$
x=\text { false, } y=\text { true, } z=\text { false. }
$$

If this graph has an independent set of size three, the original formula is satisfiable.

## From 3SAT to INDSET

$x=$ false, $y=$ false, $z=$ false.

If this graph has an independent set of size three, the original formula is satisfiable.

## From 3SAT to INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

## From 3SAT to INDSET

$(x \vee y v \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

If the original formula is satisfiable, this graph has an independent set of size three.

## From 3SAT to INDSET

$x=$ false, $y=$ true, $z=$ false.
$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y \vee \neg z)$

If the original formula is satisfiable, this graph has an independent set of size three.

## From 3SAT to INDSET

$x=$ false,$y=$ true, $z=$ false.
$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y \vee \neg z)$

If the original formula is satisfiable, this graph has an independent set of size three.

## From 3SAT to INDSET

$x=$ false,$y=$ true, $z=$ false.
$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y \vee \neg z)$

If the original formula is satisfiable, this graph has an independent set of size three.

## From 3SAT to INDSET

- Let $\varphi=C_{1} \wedge C_{2} \wedge \ldots \wedge C_{n}$ be a 3-CNF formula.
- Construct the graph $G$ as follows:
- For each clause $C_{i}=x_{1} \vee x_{2} \vee x_{3}$, where $x_{1}, x_{2}$, and $x_{3}$ are literals, add three new nodes into $G$ with edges connecting them.
- For each pair of nodes $v_{\mathrm{i}}$ and $\neg v_{\mathrm{i}}$, where $v_{\mathrm{i}}$ is some variable, add an edge connecting $\nu_{\mathrm{i}}$ and $\neg \nu_{\mathrm{i}}$. (Note that there are multiple copies of these nodes)
- Claim One: This reduction can be computed in polynomial time.
- Claim: $G$ has an independent set of size $n \operatorname{iff} \varphi$ is satisfiable.

Lemma: This reduction can be computed in polynomial time.

Proof: Suppose that the original 3-CNF formula $\varphi$ has $n$ clauses, each of which has three literals. Then we construct 3n nodes in our graph. Each clause contributes 3 edges, so there are $\mathrm{O}(n)$ edges added from clauses. For each pair of nodes representing opposite literals, we introduce one edge. Since there are $O\left(n^{2}\right)$ pairs of literals, this introduces at most $\mathrm{O}\left(n^{2}\right)$ new edges. This gives a graph with $\mathrm{O}(n)$ nodes and $O\left(n^{2}\right)$ edges. Each node and edge can be constructed in polynomial time, so overall this reduction can be computed in polynomial time, as required.

Lemma: If the graph $G$ has an independent set of size $n$ (where $n$ is the number of clauses in $\varphi$ ), then $\varphi$ is satisfiable.
Proof: Suppose $G$ has an independent set of size $n$, call if $S$. No two nodes in $S$ can correspond to $v$ and $\neg v$ for any variable $v$, because there is an edge between all nodes with this property. Thus for each variable $v$, either there is a node in $S$ with label $v$, or there is a node in $S$ with label $\neg v$, or no node in S has either label. In the first case, set $v$ to true; in the second case, set $v$ to false; in the third case, choose a value for $v$ arbitrarily. We claim that this gives a satisfying assignment for $\varphi$.
To see this, we show that each clause $C$ in $\varphi$ is satisfied. By construction, no two nodes in $S$ can come from nodes added by $C$, because each has an edge to the other. Since there are n nodes in $S$ and $n$ clauses in $\varphi$, for any clause in $\varphi$ some node corresponding to a literal from that clause is in $S$. If that node has the form $x$, then $C$ contains $x$, and since we set $x$ to true, $C$ is satisfied. If that node has the form $\neg x$, then $C$ contains $\neg \chi$, and since we set $x$ to false, $C$ is satisfied. Thus all clauses in $\varphi$ are satisfied, so $\varphi$ is satisfied by this assignment.

Lemma: If $\varphi$ is satisfiable and has $n$ clauses, then $G$ has an independent set of size $n$.

Proof: Suppose that $\varphi$ is satisfiable and consider any satisfying assignment for it. Thus under that assignment, for each clause $C$, there is some literal that evaluates to true. For each clause $C$, choose some literal that evaluates to true and add the corresponding node in $G$ to a set $S$. Then $S$ has size $n$, since it contains one node per clause.

We claim moreover that $S$ is an independent set in $G$. To see this, note that there are two types of edges in $G$ : edges between nodes representing literals in the same clause, and edges between variables and their negations. No two nodes joined by edges within a clause are in $S$, because we explicitly picked one node per clause. Moreover, no two nodes joined by edges between opposite literals are in $S$, because in a satisfying assignment both of the two could not be true. Thus no nodes in $S$ are joined by edges, so $S$ is an independent set.

## Putting it All Together

Theorem: INDSET is NP-complete.
Proof: We know that INDSET $\in$ NP, because we constructed a polynomial-time verifier for it. So all we need to show is that every problem in NP is polynomial-time reducible to INDSET.

To do this, we use the polynomial-time reduction from 3SAT to INDSET that we just gave. As we proved, $\varphi \in$ 3SAT iff $\langle\mathrm{G}, \mathrm{n}\rangle \in \operatorname{INDSET}$, and this reduction can be computed in polynomial time. Thus 3SAT is polynomial-time reducible to INDSET, so INDSET is NP-complete.

## Time-Out For Announcements!

## Final Exam Logistics

- Final exam rooms divvied up by last name:
- Aba - Ber: Go to Hewlett 101
- Bil - Ell: Go to Hewlett 102
- Emb - Gra: Go to Hewlett 103
- Gre - Zuo: Go to Hewlett 200
- Review session: This Saturday from 2:15PM - 4:15PM in Gates 104.

## Solutions Released

- We've posted solutions to the two additional practice exams to the course website.
- Have questions on the EC final exam? Email the staff list, stop by office hours, or stop by the review session!

## Your Questions

"What do the eye and the path to the tree mean in the NP slide the Friday before break?"

Font: DejaVu Serif

Font: Webdings
"Keith, during lecture you said that a majority of computer scientists believe that $\mathbf{P} \neq \mathbf{N P}$. What do you think? What degree of certainty would you assign to your guess?"
"Is it possible that $\mathbf{P}=\mathbf{N P}$ but it still takes decades to find a decider for some specific (currently) NP problem? Conversely, if $\mathbf{P} \neq \mathbf{N P}$, can we still find a decider for some specific NP problem? If so, why not just study specific problems?"

Back to CS103!

## Structuring NP-Completeness Reductions

## The Shape of a Reduction

- Polynomial-time reductions work by solving one problem with a solver for a different problem.
- Most problems in NP have different pieces that must be solved simultaneously.
- For example, in 3SAT:
- Each clause must be made true,
- but no literal and its complement may be picked.
- In INDSET:
- You can choose any nodes you want to put into the set,
- but no two connected nodes can be added.

## Reductions and Gadgets

- Many reductions used to show NP-completeness work by using gadgets.
- Each piece of the original problem is translated into a "gadget" that handles some particular detail of the problem.
- These gadgets are then connected together to solve the overall problem.

## Gadgets in INDSET

$$
(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y \vee \neg z)
$$

## Gadgets in INDSET

$$
(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y \vee \neg z)
$$

## Gadgets in INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$
7y
y

## Gadgets in INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

## Gadgets in INDSET

Each of these gadgets is designed to solve one part of the problem:
ensuring each clause is satisfied.

## Gadgets in INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

## Gadgets in INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

## Gadgets in INDSET

$(x \vee y \vee \neg z) \wedge(\neg x \vee \neg y \vee z) \wedge(\neg x \vee y v \neg z)$

These connections ensure that the solutions to each gadget are linked to one another.

## Gadgets in INDSET

## A More Complex Reduction

A 3-coloring of a graph is a way of coloring its nodes one of three colors such that no two connected nodes have the same color.

A 3-coloring of a graph is a way of coloring its nodes one of three colors such that no two connected nodes have the same color.

A 3-coloring of a graph is a way of coloring its nodes one of three colors such that no two connected nodes have the same color.

## The 3-Coloring Problem

- The 3-coloring problem is

Given an undirected graph $G$, is there a legal 3-coloring of its nodes?

- As a formal language: 3COLOR $=\{\langle G\rangle \mid G$ is an undirected
graph with a legal 3-coloring. $\}$
- This problem is known to be NP-complete by a reduction from 3SAT.

## $3 C O L O R \in \mathbf{N P}$

- We can prove that 3COLOR $\in$ NP by designing a polynomial-time nondeterministic TM for 3COLOR.
- $\mathrm{M}=$ " On input $\langle G\rangle$ :
- Nondeterministically guess an assignment of colors to the nodes.
- Deterministically check whether it is a 3-coloring.
- If so, accept; otherwise reject."

## A Note on Terminology

- Although 3COLOR and 3SAT both have " 3 " in their names, the two are very different problems.
- 3SAT means "there are three literals in every clause." However, each literal can take on only one of two different values.
- 3COLOR means "every node can take on one of three different colors."
- Key difference:
- In 3SAT variables have two choices of value.
- In 3COLOR nodes have three choices of value.

## Why Not Two Colors?

- It would seem that 2COLOR (whether a graph has a 2-coloring) would be a better fit.
- Every variable has one of two values.
- Every node has one of two values.
- Interestingly, 2COLOR is known to be in $\mathbf{P}$ and is conjectured not to be NP-complete.
- Though, if you can prove that it is, you've just won $\$ 1,000,000$ !

## From 3SAT to 3COLOR

- In order to reduce 3SAT to 3COLOR, we need to somehow make a graph that is 3-colorable iff some 3-CNF formula $\varphi$ is satisfiable.
- Idea: Use a collection of gadgets to solve the problem.
- Build a gadget to assign two of the colors the labels "true" and "false."
- Build a gadget to force each variable to be either true or false.
- Build a series of gadgets to force those variable assignments to satisfy each clause.

## Gadget One: Assigning Meanings

## Gadget One: Assigning Meanings

These nodes
must all have different colors.

## Gadget One: Assigning Meanings

These nodes
must all have different colors.

The color assigned to $T$ will be interpreted as "true." The color assigned to F will be interpreted as "false." We do not associate any special meaning with 0 .

## Putting It All Together

- Construct the first gadget so we have a consistent definition of true and false.
- For each variable $v$ :
- Construct nodes $v$ and $\neg v$.
- Add an edge between $v$ and $\neg v$.
- Add an edge between $v$ and O and between $\neg v$ and 0 .
- For each clause $C$ :
- Construct the earlier gadget from $C$ by adding in the extra nodes and edges.

## Putting It All Together

## Analyzing the Reduction

- How large is the resulting graph?
- We have $O(1)$ nodes to give meaning to "true" and "false."
- Each variable gives $O(1)$ nodes for its true and false values.
- Each clause gives O(1) nodes for its colorability gadget.
- Collectively, if there are $n$ clauses, there are O(n) variables.
- Total size of the graph is $\mathrm{O}(n)$.

## Next Time

- The Big Picture
- How do all of our results relate to one another?
- Where to Go from Here
