

# Methods

# Drawing Geometrical Objects

# Drawing Geometrical Objects

## Constructors

```
new GRect ( x , y , width , height )
```

Creates a rectangle whose upper left corner is at  $(x, y)$  of the specified size

# Drawing Geometrical Objects

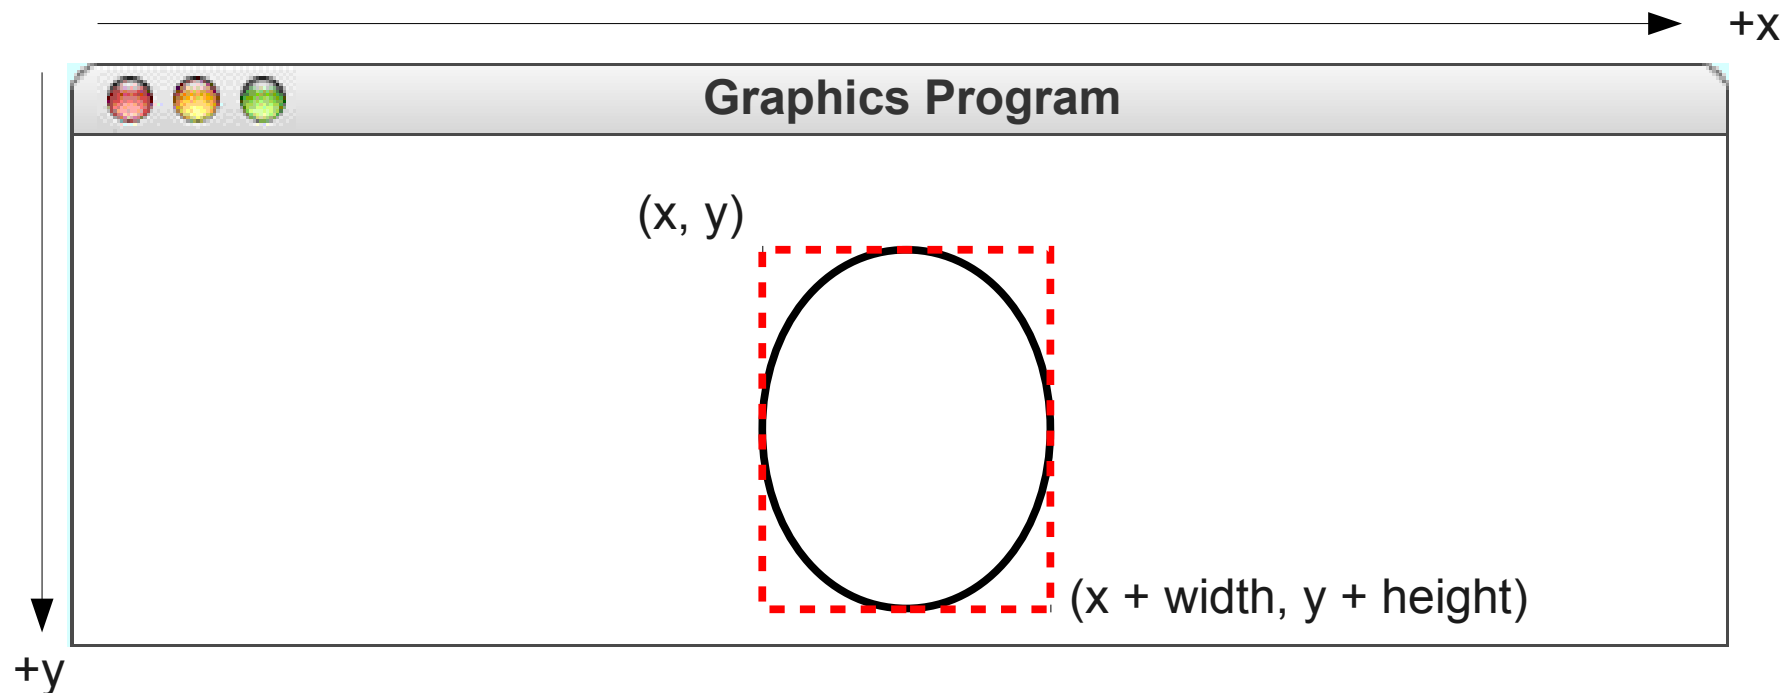

## Constructors

**`new GRect ( x, y, width, height)`**

Creates a rectangle whose upper left corner is at  $(x, y)$  of the specified size

**`new GOval ( x, y, width, height)`**

Creates an oval that fits inside the rectangle with the same dimensions.

# Drawing Geometrical Objects

## Constructors

**new GRect** ( $x, y, width, height$ )

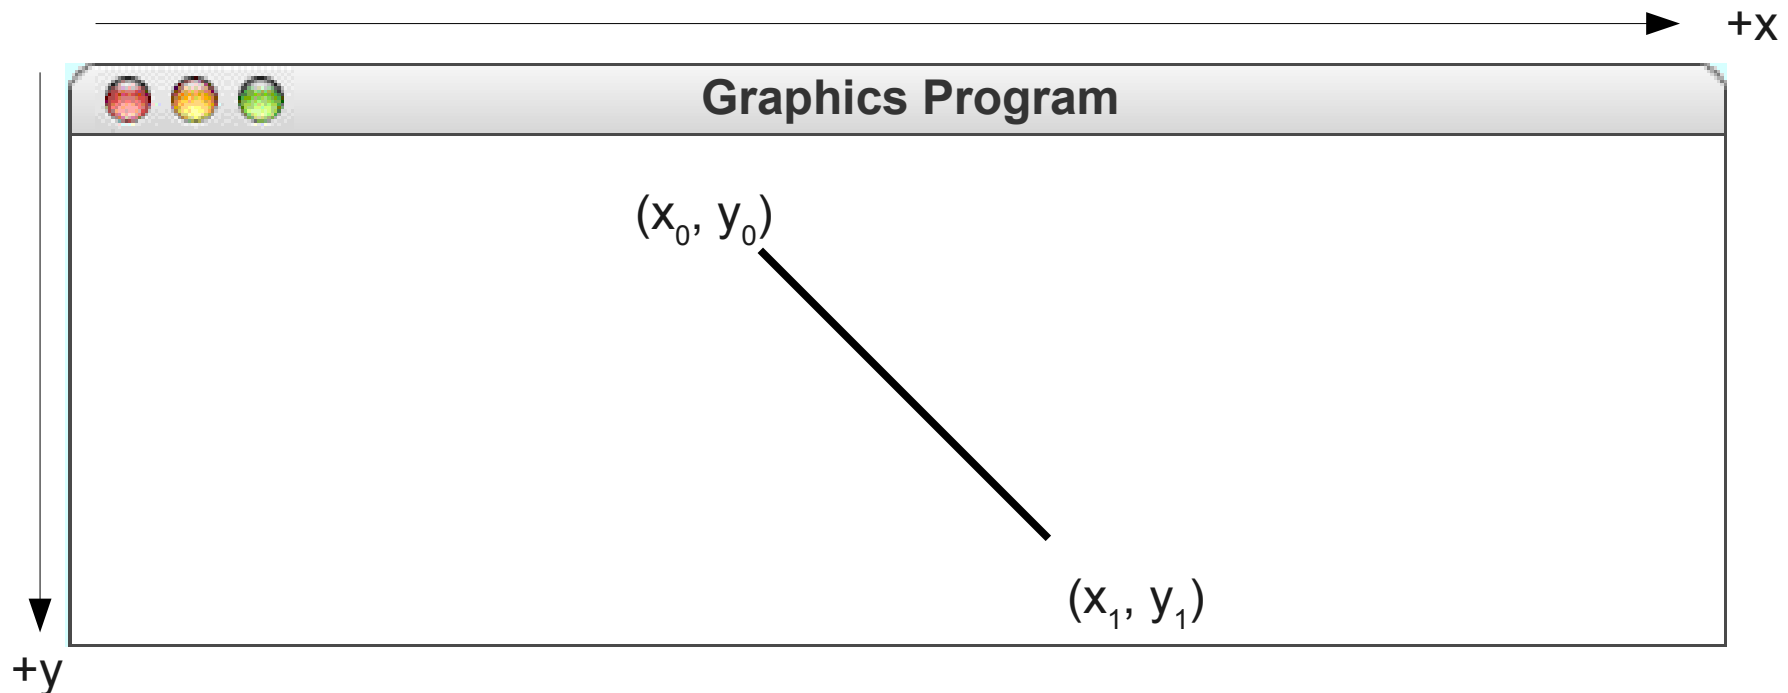

Creates a rectangle whose upper left corner is at  $(x, y)$  of the specified size

**new GOval** ( $x, y, width, height$ )

Creates an oval that fits inside the rectangle with the same dimensions.

**new GLine** ( $x_0, y_0, x_1, y_1$ )

Creates a line extending from  $(x_0, y_0)$  to  $(x_1, y_1)$ .

Each point  $k$  is connected to point  $k + 2$ , after wrapping around.

Each point  $k$  is connected to point  $k + 2$ , after wrapping around.

Point  $k$  is at  $\frac{k}{numSides} \times 360^\circ$

Each point  $k$  is connected to point  $k + 2$ , after wrapping around.

Point  $k$  is at  $\frac{k}{numSides} \times 360^\circ$

Each point  $k$  is connected to point  $k + 2$ , after wrapping around.

Point  $k$  is at  $\frac{k}{numSides} \times 360^\circ$

# Passing Parameters

- A method can accept **parameters** when it is called.
- Syntax:

```
private void name(parameters) {  
    /* ... method body ... */  
}
```

- The values of the parameters inside the method are set when the method is called.
- The values of the parameters can vary between calls.

Time-Out For Announcements!

# Friday Four Square!

Today at 4:15PM, Outside Gates

# Assignment 2

- Assignment 2 is due a week from today.
- **Recommendation:** Have the first five problems completed by Monday.
- Have questions? Stop by the LaIR, Keith's/Vikas's office hours, or email your section leader!

Back to CS106A!

# Factorials

- The number  **$n$  factorial**, denoted  **$n!$** , is

$$1 \times 2 \times 3 \times \dots \times (n - 1) \times n$$

- For example:
  - $3! = 1 \times 2 \times 3 = 6$ .
  - $5! = 1 \times 2 \times 3 \times 4 \times 5 = 120$
  - $0! = 1$  (by definition)
- Factorials show up everywhere:
  - Taylor series.
  - Counting ways to shuffle a deck of cards.
  - Determining how quickly computers can sort values.

# Returning Values

- A method may produce a value that can be read by its caller.
- To indicate that a method returns a value, specify the type returned in the method declaration:

```
private type name (parameters) {  
    /* ... method body ... */  
}
```

- A value can be returned with the **return** statement:

```
return value;
```

# Subtleties of `return`

- If a method has non-`void` return type, it must always return a value.

```
private int thisIsWrong(int x) {  
    if (x == 5) {  
        return 0;  
    }  
}
```

What do we  
return if `x != 5`?

# Subtleties of `return`

- If a method has non-`void` return type, it must always return a value.

```
private int thisIsLegal(int x) {  
    if (x == 5) {  
        return 0;  
    } else {  
        return 1;  
    }  
}
```

# Many Happy `return`s

- A method may have multiple return statements. The method ends as soon as `return` is executed.

```
private int thisIsLegal(int x) {  
    if (x == 5) {  
        return 0;  
    } else {  
        return 1;  
    }  
}
```

# Many Happy `return`s

- A method may have multiple return statements. The method ends as soon as `return` is executed.

```
private int thisIsLegal(int x) {  
    if (x == 5) {  
        return 0;  
    }  
    return 1;  
}
```

The only way we can get here is if x is not equal to 5.
