

# Functions in C++

# Announcements

- Dawson's office hours changed to Monday – Thursday, 11AM – Noon.
- Section signups open tomorrow at 5PM and close Sunday at 5PM.
- Sign up for section at  
**<http://cs198.stanford.edu/section>**
- Link available on the CS106B course website.

# Announcements

- Dinner talk about patent law in technology with Twitter head of IP litigation next **Tuesday, April 9** at **7:30PM** in **Gates 219**.
- RSVP through email link; will send out later today.

she++ ++

C++

# C++ Functions

- Functions in C++ are similar to methods in Java:
  - Piece of code that performs some task.
  - Can accept parameters.
  - Can return a value.
- Syntax similar to Java:

```
 return-type function-name (parameters) {  
/* ... function body ... */
```

Note: no  
**public** or  
**private**.

# The main Function

- A C++ program begins execution in a function called `main` with the following signature:

```
int main() {  
    /* ... code to execute ... */  
}
```

- By convention, `main` should return 0 unless the program encounters an error.

# A Simple C++ Program

What Went Wrong?

# One-Pass Compilation

- Unlike some languages like Java or C#, C++ has a **one-pass compiler**.
- If a function has not yet been declared when you try to use it, you will get a compiler error.

# Function Prototypes

- A **function prototype** is a declaration that tells the C++ compiler about an upcoming function.
- Syntax:  
***return-type function-name (parameters) ;***
- A function can be used if the compiler has seen either the function itself or its prototype.

# Getting Input from the User

- In C++, we use `cout` to display text.
- We can also use `cin` to receive input.
- For technical reasons, we've written some functions for you that do input.
  - Take CS106L to see why!
- The library "`simpio.h`" contains methods for reading input:

```
int getInteger(string prompt = "");
```

```
double getReal(string prompt = "");
```

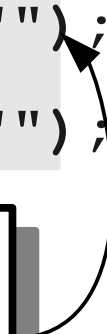

```
string getLine(string prompt = "");
```

# Getting Input from the User

- In C++, we use `cout` to display text.
- We can also use `cin` to receive input.
- For technical reasons, we've written some functions for you that do input.
  - Take CS106L to see why!
- The library "`simpio.h`" contains methods for reading input:

```
int getInteger(string prompt = "");  
double getReal(string prompt = "");  
string getLine(string prompt = "");
```

These functions have **default arguments**. If you don't specify a prompt, it will use the empty string.

# Factorials

- The number  **$n$  factorial**, denoted  **$n!$** , is

$$n \times (n - 1) \times \dots \times 3 \times 2 \times 1$$

- For example:
  - $3! = 3 \times 2 \times 1 = 6$ .
  - $5! = 5 \times 4 \times 3 \times 2 \times 1 = 120$
  - $0! = 1$  (by definition)
- Factorials show up everywhere:
  - Taylor series.
  - Counting ways to shuffle a deck of cards.
  - Determining how quickly computers can sort values (more on that later this quarter).

# Digital Roots

- The **digital root** of a number can be found as follows:
  - If the number is just one digit, then it's its own digital root.
  - If the number is multiple digits, add up all the digits and repeat.
- For example:
  - 5 has digital root 5.
  - $42 \rightarrow 4 + 2 = 6$ , so 42 has digital root 6.

# Digital Roots

- The **digital root** of a number can be found as follows:
  - If the number is just one digit, then it's its own digital root.
  - If the number is multiple digits, add up all the digits and repeat.
- For example:
  - 5 has digital root 5.
  - $42 \rightarrow 4 + 2 = 6$ , so 42 has digital root 6.
  - $137 \rightarrow 1 + 3 + 7 = 11$   
 $11 \rightarrow 1 + 1 = 2$ ,  
so 137 has digital root 2.

                        }  
                    }  
                }  
            }  
        }  
    }  
}
```

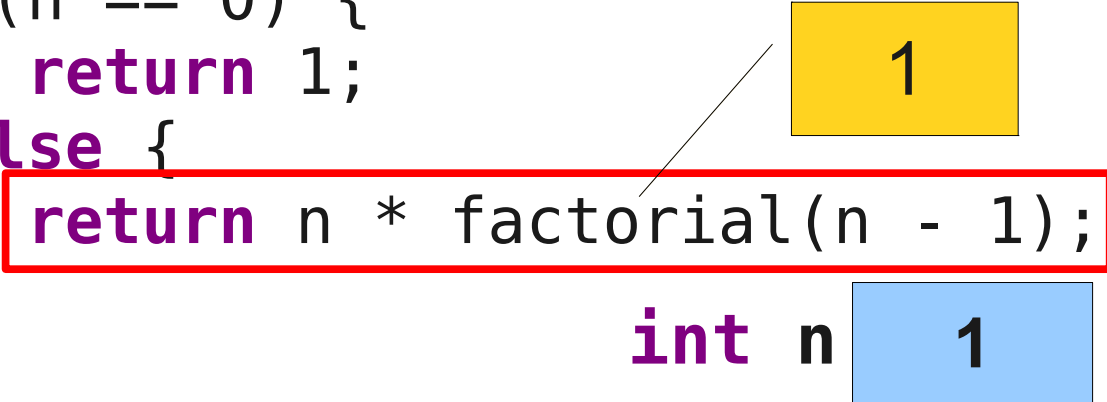

Diagram illustrating recursive calls for factorial(1). The code is shown with nested boxes representing function calls. A yellow box with '1' is connected by a line to the 'factorial(n - 1)' part of the 'return' statement in the innermost function call. A blue box with '1' is positioned next to the 'int n' parameter of the same innermost call.

# Recursion in Action

```
int main() {  
    int factorial(int n) {  
        int factorial(int n) {  
            int factorial(int n) {  
                int factorial(int n) {  
                    if (n == 0) {  
                        return 1;  
                    } else {  
                        return n * factorial(n - 1);  
                    }  
                }  
            }  
        }  
    }  
}
```

int n 2

# Recursion in Action

```
int main() {  
    int factorial(int n) {  
        int factorial(int n) {  
            int factorial(int n) {  
                int factorial(int n) {  
                    if (n == 0) {  
                        return 1;  
                    } else {  
                        return n * factorial(n - 1);  
                    }  
                }  
            }  
        }  
    }  
}
```

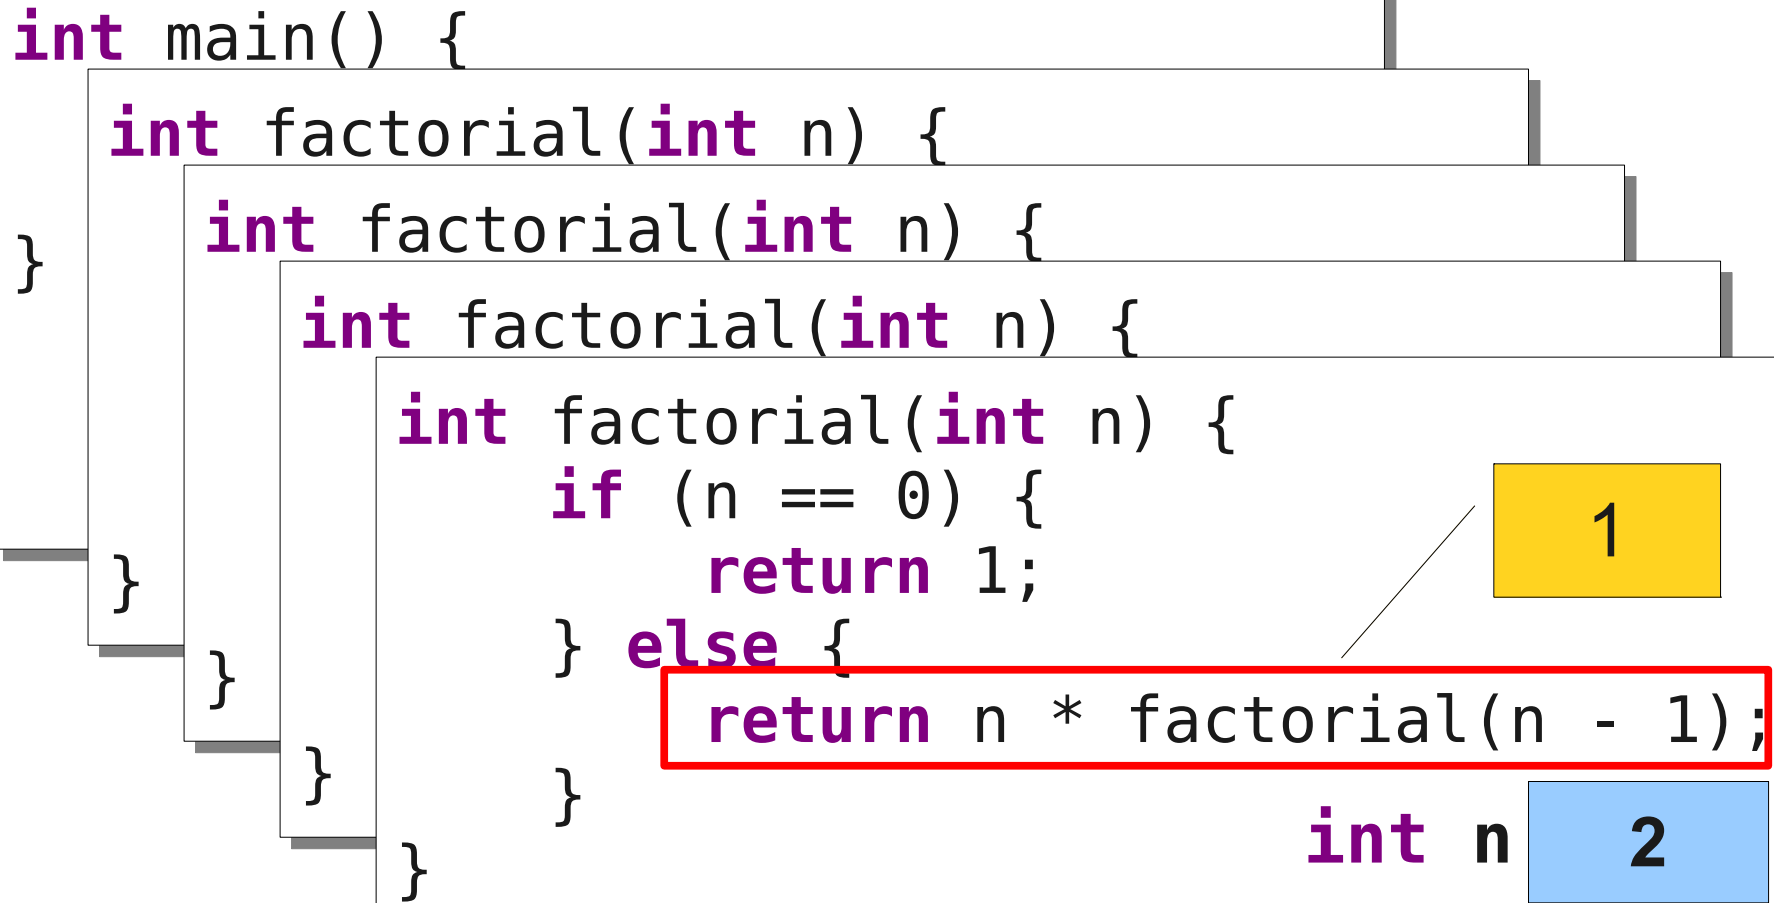

Diagram illustrating recursive calls for factorial(2). The code is shown with nested boxes representing function calls. A yellow box with the number 1 is connected by a line to the `return 1;` statement in the innermost function call. A blue box with the number 2 is positioned next to the `int n` declaration in the outermost function call. The `return n * factorial(n - 1);` line in the outermost call is highlighted with a red box.

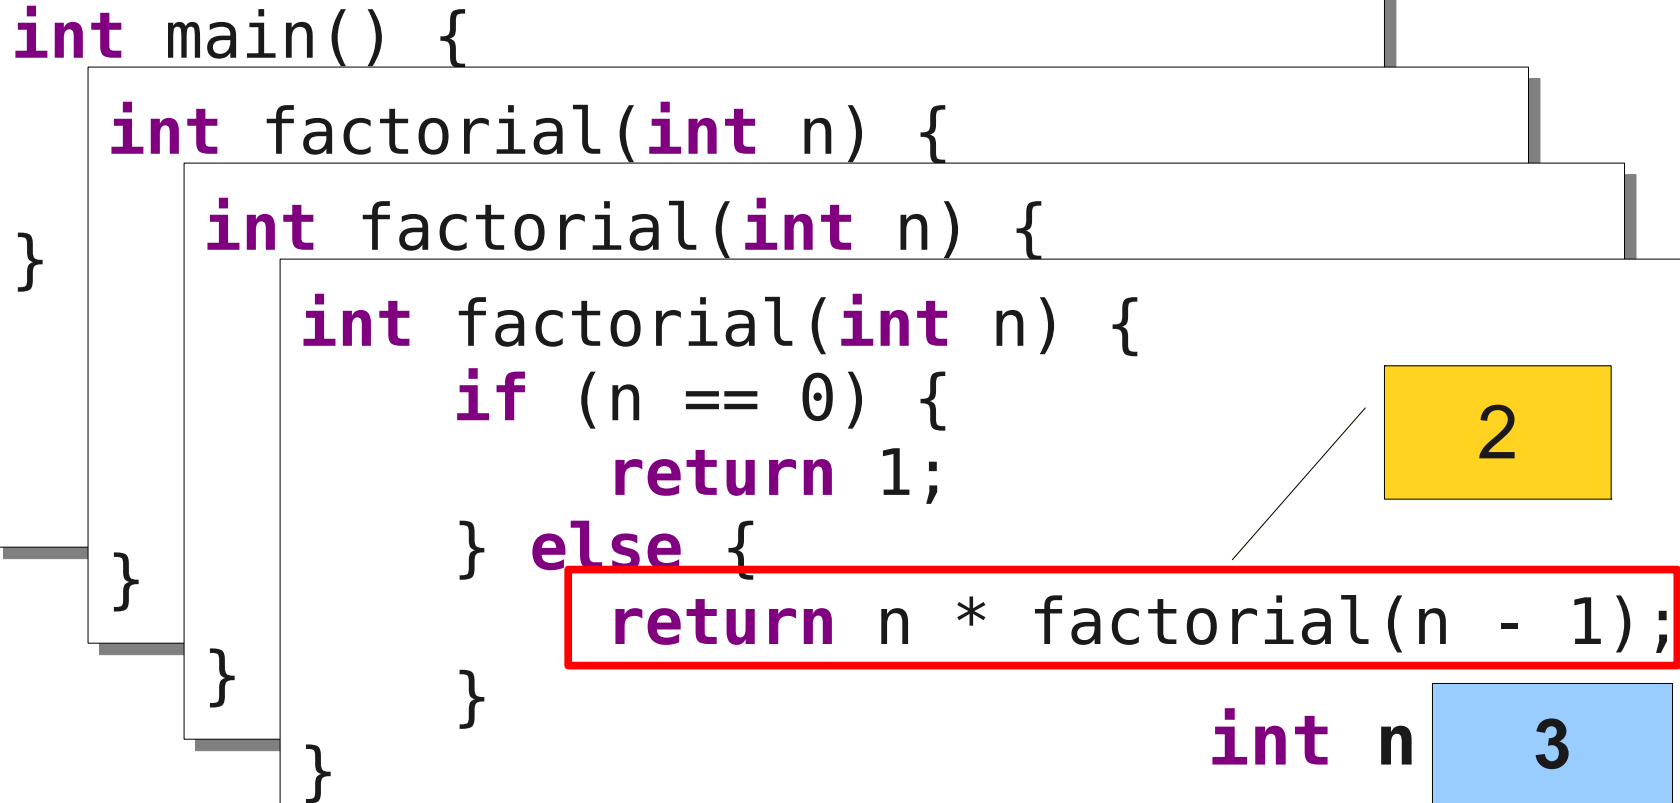

# Recursion in Action

```
int main() {  
    int factorial(int n) {  
        int factorial(int n) {  
            int factorial(int n) {  
                if (n == 0) {  
                    return 1;  
                } else {  
                    return n * factorial(n - 1);  
                }  
            }  
        }  
    }  
}
```

int n 3

# Recursion in Action

```
int main() {  
    int factorial(int n) {  
        int factorial(int n) {  
            int factorial(int n) {  
                if (n == 0) {  
                    return 1;  
                } else {  
                    return n * factorial(n - 1);  
                }  
            }  
        }  
    }  
}
```

The diagram illustrates the recursive calls for calculating the factorial of 3. The code is shown in four overlapping boxes, representing the call stack. A yellow box with the number 2 is connected by a line to the recursive call `factorial(n - 1)` in the second-to-last box. A blue box with the number 3 is next to the variable `n` in the last box, which is the current frame.

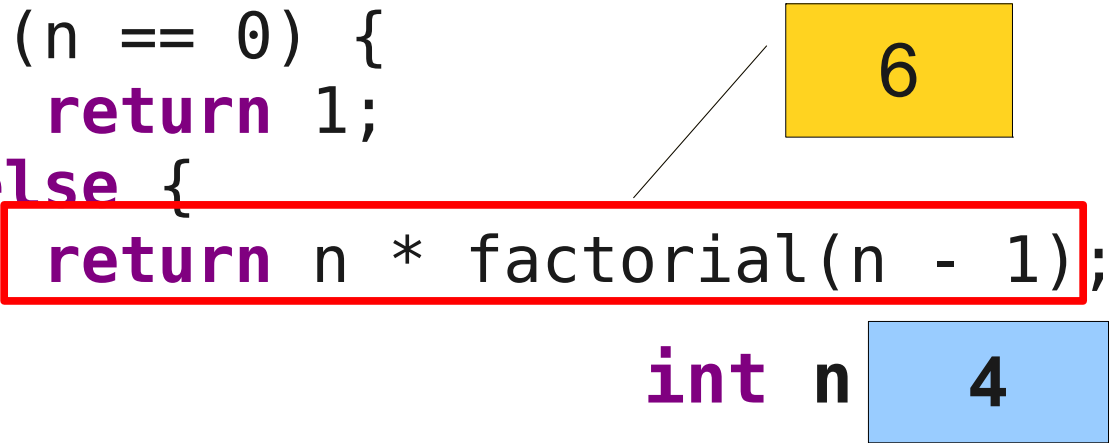

# Recursion in Action

```
int main() {  
    int factorial(int n) {  
        int factorial(int n) {  
            if (n == 0) {  
                return 1;  
            } else {  
                return n * factorial(n - 1);  
            }  
        }  
    }  
}
```

int n 4

# Recursion in Action

```
int main() {  
    int factorial(int n) {  
        int factorial(int n) {  
            if (n == 0) {  
                return 1;  
            } else {  
                return n * factorial(n - 1);  
            }  
        }  
    }  
}
```

The diagram illustrates the recursive calculation of the factorial of 4. The code shows three nested function calls for `factorial`. The innermost call is for `n = 4`, represented by a blue box. The return value of this call, 6, is shown in a yellow box. A line connects the yellow box to the recursive call `factorial(n - 1)` in the code, indicating that the result of the recursive call is used in the calculation.

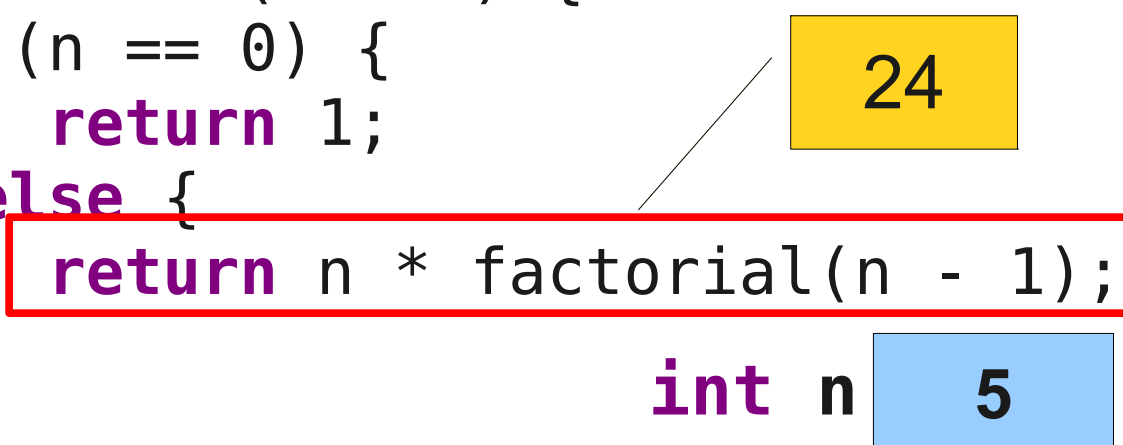

# Recursion in Action

```
int main() {  
    int factorial(int n) {  
        if (n == 0) {  
            return 1;  
        } else {  
            return n * factorial(n - 1);  
        }  
    }  
}
```

int n 5

# Recursion in Action

```
int main() {  
    int factorial(int n) {  
        if (n == 0) {  
            return 1;  
        } else {  
            return n * factorial(n - 1);  
        }  
    }  
}
```

The diagram illustrates a recursive call in a factorial function. A yellow box containing the number 24 is connected by a line to the recursive call `factorial(n - 1)` in the code. A blue box containing the number 5 is next to the variable `n` in the function signature, indicating the current value of `n`.

# Recursion in Action

```
int main() {  
    int n = factorial(5);  
    cout << "5! = " << n << endl;  
}
```

# Recursion in Action

```
int main() {  
    int n = factorial(5);  
    cout << "5! = " << n << endl;  
}
```

int n 120

# Recursion in Action

```
int main() {  
    int n = factorial(5);  
    cout << "5! = " << n << endl;  
}
```

int n 120

# Thinking Recursively

- Solving a problem with recursion requires two steps.
- First, determine how to solve the problem for simple cases.
  - This is called the **base case**.
- Second, determine how to break down larger cases into smaller instances.
  - This is called the **recursive decomposition**.

# Thinking Recursively

```
if (problem is sufficiently simple) {  
    Directly solve the problem.  
    Return the solution.  
} else {  
    Split the problem up into one or more smaller  
    problems with the same structure as the original.  
    Solve each of those smaller problems.  
    Combine the results to get the overall solution.  
    Return the overall solution.  
}
```

# Summing Up Digits

- One way to compute the sum of the digits of a number is shown here:

```
int sumOfDigits(int n) {  
    int result = 0;  
    while (n != 0) {  
        result += n % 10;  
        n /= 10;  
    }  
    return result;  
}
```

- How would we rewrite this function recursively?

# Summing Up Digits

The sum of these digits  
of this number...

is equal to the sum of  
the digits of this  
number...

# Summing Up Digits

The sum of these digits  
of this number...

is equal to the sum of  
the digits of this  
number...

plus this number.

# Summing Up Digits

- A recursive implementation of `sumOfDigits` is shown here:

```
int sumOfDigits(int n) {  
    if (n < 10) {  
        return n;  
    } else {  
        return (n % 10) + sumOfDigits(n / 10);  
    }  
}
```

- Notice the structure:
  - If the problem is sufficiently simple, solve it directly.
  - Otherwise, reduce it to a smaller instance and solve that one.

# Computing Digital Roots

- One way of computing a digital root is shown here:

```
int digitalRoot(int n) {  
    while (n >= 10) {  
        n = sumOfDigits(n);  
    }  
    return n;  
}
```

- How might we rewrite this function recursively?

# Digital Roots

# Digital Roots

The digital root of **9 2 5 8**

# Digital Roots

The digital root of **9 2 5 8** is the same as

# Digital Roots

The digital root of **9 2 5 8** is the same as

The digital root of  **$9+2+5+8$**

# Digital Roots

The digital root of **9 2 5 8** is the same as

The digital root of **2 4**

# Digital Roots

The digital root of **9 2 5 8** is the same as

The digital root of **2 4** which is the same as

# Digital Roots

The digital root of **9 2 5 8** is the same as

The digital root of **2 4** which is the same as

The digital root of **2 + 4**

# Digital Roots

The digital root of 9 2 5 8 is the same as

The digital root of 2 4 which is the same as

The digital root of 6

# Computing Digital Roots

- Here is one recursive solution:

```
int digitalRoot(int n) {  
    if (n < 10) {  
        return n;  
    } else {  
        return digitalRoot(sumOfDigits(n));  
    }  
}
```

- Again, notice the structure:
  - Check if the problem is simple enough to solve directly.
  - If not, solve a smaller version of the same problem.
