

Thinking Recursively

Part V

Friday Four Square!

Today at 4:15PM at
Gates Computer Science

WiCS Hackathon

- Stanford Women in Computer Science are running a hackathon this **Sunday** from 10AM – 10PM in the Huang Engineering Center basement.
 - (That's right outside of this classroom!)
 - Free food!
 - RSVP at **<http://hackoverflow.org>**

A Little Word Puzzle

“What nine-letter word can be reduced to a single-letter word one letter at a time by removing letters, leaving it a legal word at each step?”

One Solution

S	T	A	R	T	L	I	N	G
---	---	---	---	---	---	---	---	---

One Solution

S	T	A	R	T	I	N	G
---	---	---	---	---	---	---	---

One Solution

S	T	A	R	I	N	G
---	---	---	---	---	---	---

One Solution

S	T	R	I	N	G
---	---	---	---	---	---

One Solution

S	T	I	N	G
---	---	---	---	---

One Solution

S	I	N	G
---	---	---	---

One Solution

S	I	N
---	---	---

One Solution

I	N
---	---

One Solution

All Possible Paths

All Possible Paths

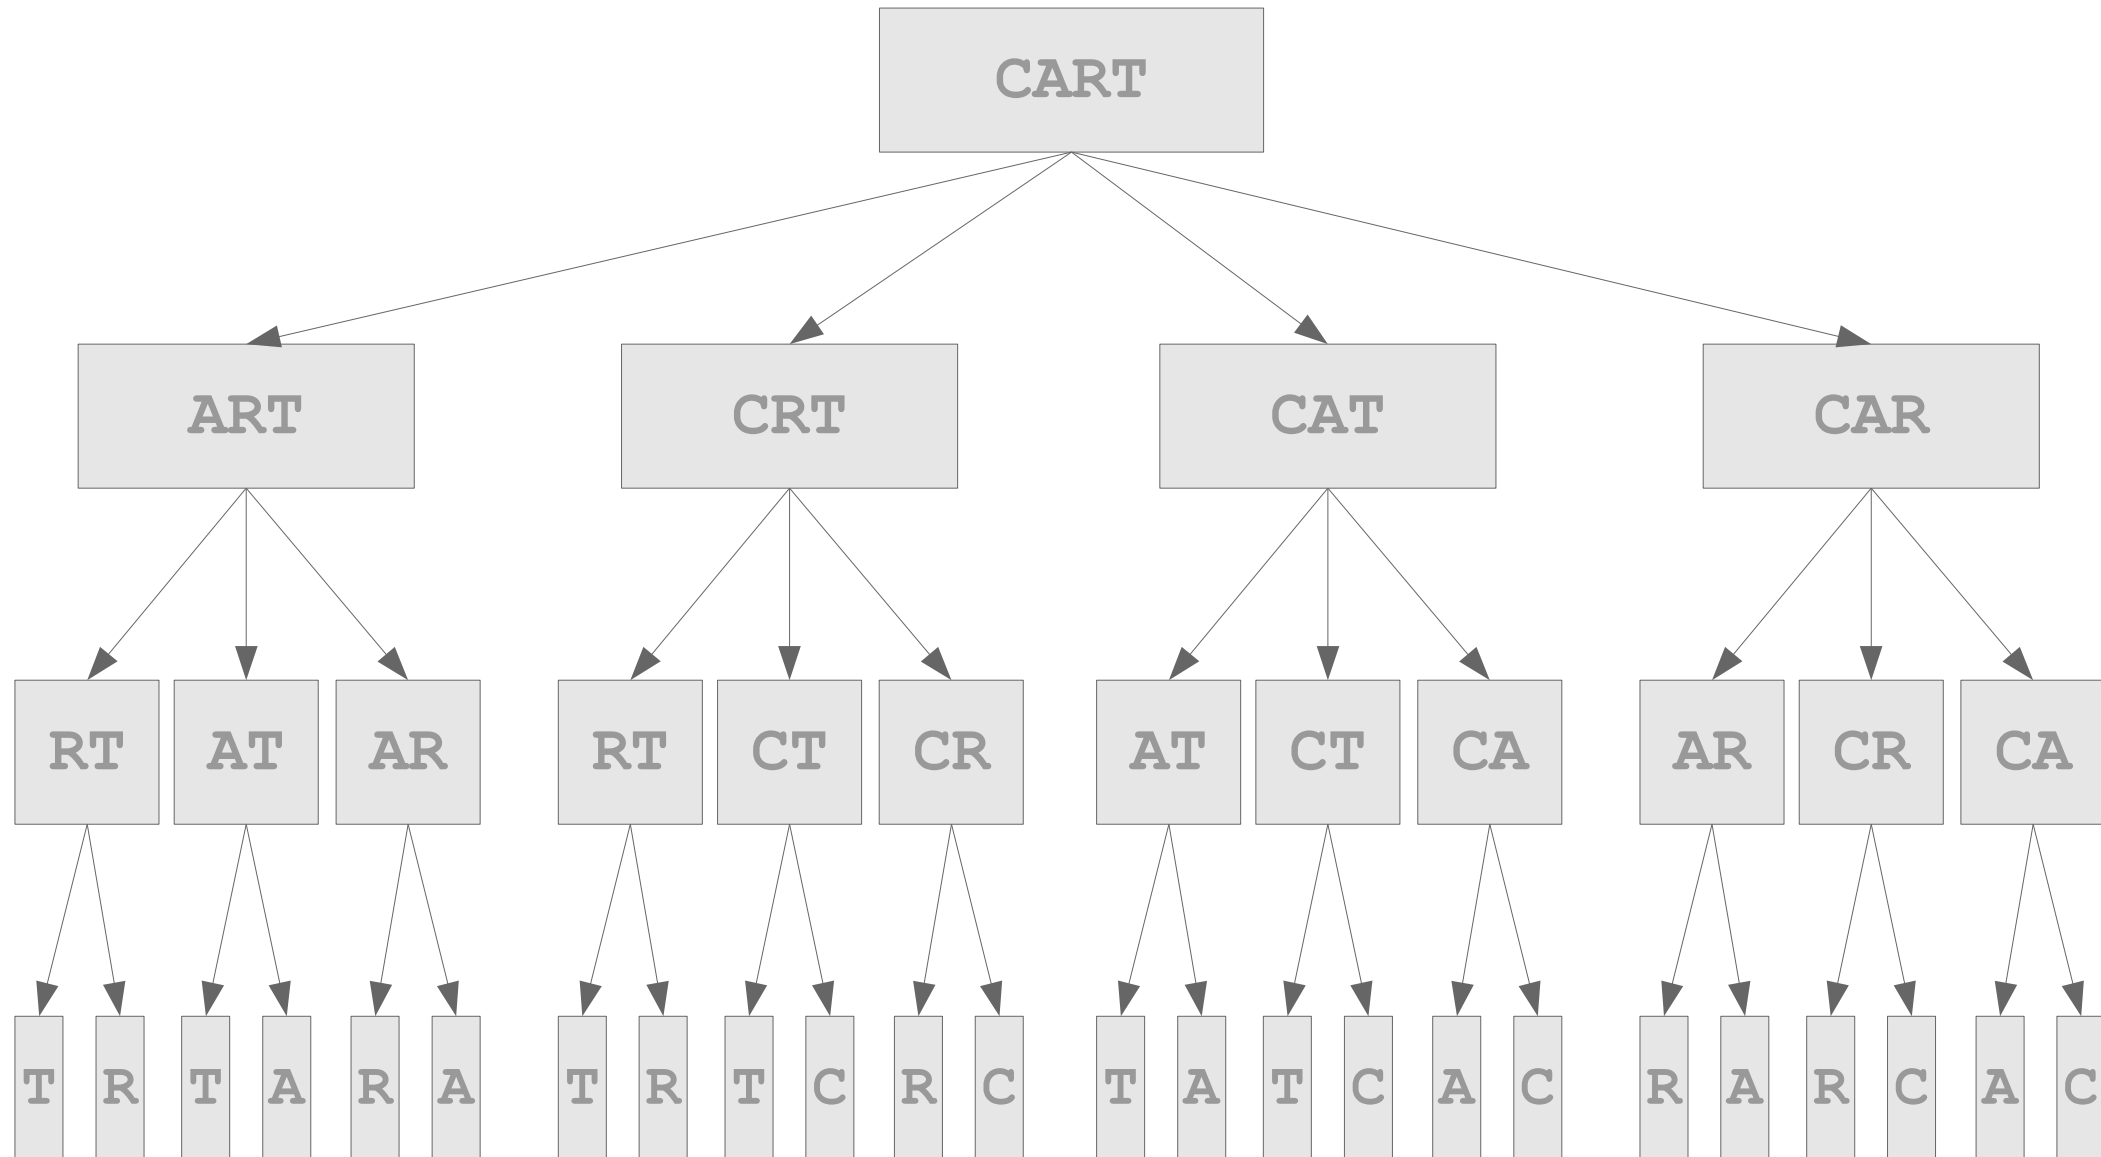

Shrinkable Words

- Let's define a **shrinkable word** as a word that can be reduced down to one letter by removing one character at a time, leaving a word at each step.
- **Base Cases:**
 - Any string that is not a word cannot be a shrinkable word.
 - Any single-letter word is shrinkable.
 - A, I, O
- **Recursive Step:**
 - Any multi-letter word is shrinkable if you can remove a letter to form a shrinkable word.

```
if (problem is sufficiently simple) {  
    return whether or not the problem is solvable  
}  
else {  
    for (each choice) {  
        try out that choice.  
        if (that choice leads to success) {  
            return success  
        }  
    }  
    return failure  
}
```

Extracting a Solution

- We now have a list of words that allegedly are shrinkable, but we don't actually know how to shrink them!
- Can the function tell us *how* to shrink the word?

Output Parameters

- An **output parameter** (or **outparam**) is a parameter to a function that stores the result of that function.
- Caller passes the parameter by reference, function overwrites the value.
- Useful if you need to return multiple values.

Generating Dense Crosswords

Generating Dense Crosswords

- Work downward one row at a time, at each point ensuring the columns are valid prefixes of a word.
- **Base Case:**
 - If all rows have been filled in legally, we're done!
- **Recursive Step:**
 - For each possible next word, try placing that word (checking that it doesn't conflict with a column) and recursively place remaining rows.

Interesting Exercise

- ***Make this program faster!***
 - Right now, it takes a *long* time to find a 7×7 or 8×8 crossword.
 - What other ways might you prune the search space?
 - Is there a more intelligent way to fill in the grid?

Next Time

- **Algorithmic Analysis**
 - How do we formally analyze the complexity of a piece of code?
 - How can we do so while maintaining sanity?
