Running out of Space

- Our current implementation very quickly runs out of space to store elements.
- What should we do when this happens?

Analyzing Our Approach

- We now have a working solution, but is it an *efficient* solution?
- Let's analyze the big-O complexity of the five operations.
 - **size:**
 - **isEmpty:**
 - **push:**
 - **pop:**
 - **top:**

Analyzing Our Approach

- We now have a working solution, but is it an *efficient* solution?
- Let's analyze the big-O complexity of the five operations.
 - **size: $O(1)$**
 - **isEmpty: $O(1)$**
 - **push: $O(n)$**
 - **pop: $O(1)$**
 - **top: $O(1)$**

What This Means

- What is the complexity of pushing n elements and then popping them?

What This Means

- What is the complexity of pushing n elements and then popping them?
- Cost of the pushes:
 - $1 + 2 + 3 + 4 + \dots + n$

What This Means

- What is the complexity of pushing n elements and then popping them?
- Cost of the pushes:
 - $1 + 2 + 3 + 4 + \dots + n = \mathbf{O(n^2)}$

What This Means

- What is the complexity of pushing n elements and then popping them?
- Cost of the pushes:
 - $1 + 2 + 3 + 4 + \dots + n = \mathbf{O(n^2)}$
- Cost of the pops:
 - $1 + 1 + 1 + 1 + \dots + 1$

What This Means

- What is the complexity of pushing n elements and then popping them?
- Cost of the pushes:
 - $1 + 2 + 3 + 4 + \dots + n = \mathbf{O(n^2)}$
- Cost of the pops:
 - $1 + 1 + 1 + 1 + \dots + 1 = \mathbf{O(n)}$

What This Means

- What is the complexity of pushing n elements and then popping them?
- Cost of the pushes:
 - $1 + 2 + 3 + 4 + \dots + n = \mathbf{O(n^2)}$
- Cost of the pops:
 - $1 + 1 + 1 + 1 + \dots + 1 = \mathbf{O(n)}$
- Total cost:

What This Means

- What is the complexity of pushing n elements and then popping them?
- Cost of the pushes:
 - $1 + 2 + 3 + 4 + \dots + n = \mathbf{O(n^2)}$
- Cost of the pops:
 - $1 + 1 + 1 + 1 + \dots + 1 = \mathbf{O(n)}$
- Total cost: $\mathbf{O(n^2)}$

Validating Our Model

Speeding up the Stack

What Just Happened?

- Half of our pushes are now “easy” pushes, and half of our pushes are now “hard” pushes.
- Hard pushes still take time $O(n)$.
- Easy pushes only take time $O(1)$.
- Worst-case is still $O(n)$.
- What about the average case?

Analyzing the Work

Analyzing the Work

Analyzing the Work

We cut down the
amount of work
by roughly one
half!

A Different Analysis

Let's Give it a Try!

How do we analyze this?

Spreading the Work

Spreading the Work

Spreading the Work

Spreading the Work

Spreading the Work

Spreading the Work

Spreading the Work

Spreading the Work

Spreading the Work

Spreading the Work

Spreading the Work

On average, we do
just 3 units of work!

This is $O(1)$ work on
average!

Sharing the Burden

- We still have “heavy” pushes taking time $O(n)$ and “light” pushes taking time $O(1)$.
- Worst-case time for a push is $O(n)$.
- Heavy pushes become so rare that the **average** time for a push is $O(1)$.
- Can we confirm this?

Amortized Analysis

- The analysis we have just done is called an **amortized analysis**.
- Reason about the total amount of work done, not the work done per operation.
- In an amortized sense, our implementation of the stack is extremely fast!
- This is one of the most common approaches to implementing **Stack**.

Implementing Queue

Implementing Queue

- We've just used dynamic arrays to implement a stack. Could we use them to implement a queue?
- Yes, but here's a better idea: **could we use our stack to implement a queue?**

The Two-Stack Queue

The Two-Stack Queue

The Two-Stack Queue

The Two-Stack Queue

- Maintain two stacks, an **In** stack and an **Out** stack.
- To enqueue an element, push it onto the **In** stack.
- To dequeue an element:
 - If the **Out** stack is empty, pop everything off the **In** stack and push it onto the **Out** stack.
 - Pop the **Out** stack and return its value.

Analyzing Efficiency

- How efficient is our two-stack queue?
- All enqueues just do one push.
- A dequeue might do a lot of pushes *and* a lot of pops.
- However, let's do an amortized analysis:
 - Each element is pushed at most twice and popped at most twice.
 - n enqueues and n dequeues thus do at most $4n$ pushes and pops.
 - Any $4n$ pushes / pops takes $O(n)$ amortized time.
 - Amortized cost: **$O(1)$** per operation.

Next Time

- **Linked Lists**
 - A different way to represent sequences of elements.
- **Dynamic Allocation Revisited**
 - What else can we allocate?
