

# CS193P - Lecture 10

## iPhone Application Development

### Performance

# Announcements

# Announcements

- Paparazzi 2 is due next Wednesday at 11:59pm

# Announcements

- Paparazzi 2 is due next Wednesday at 11:59pm
- Friday section tomorrow at 4 PM, Building 260 Room 113
  - Yelp

# A little more Core Data

# A little more Core Data

- NSFetchResultsController
  - Interacts with the Core Data database on your behalf
  - [fetchResultsController objectAtIndexPath:] gets at row data
  - [fetchResultsController sections] gets at section data

# A little more Core Data

- NSFetchResultsController
  - Interacts with the Core Data database on your behalf
  - [fetchResultsController objectAtIndexPath:] gets at row data
  - [fetchResultsController sections] gets at section data
- NSFetchedResultsController
  - Protocol defining methods that you can call from your UITableViewDataSource methods
    - numberOfSectionsInTableView:
    - tableView:numberOfRowsInSection:
    - tableView:cellForRowAtIndexPath:

# Today's Topics

- Memory Usage
  - Leaks
  - Autorelease
  - System warnings
- Concurrency
  - Threads
  - Operations and queues
- Additional Tips & Tricks

# iPhone Performance Overview

# iPhone Performance Overview

- iPhone applications must work with...
  - Limited memory
  - Slow or unavailable network resources
  - Less powerful hardware

# iPhone Performance Overview

- iPhone applications must work with...
  - Limited memory
  - Slow or unavailable network resources
  - Less powerful hardware
- Write your code with these constraints in mind

# iPhone Performance Overview

- iPhone applications must work with...
  - Limited memory
  - Slow or unavailable network resources
  - Less powerful hardware
- Write your code with these constraints in mind
- **Use performance tools** to figure out where to invest

# Memory Usage

# Memory on the iPhone

# Memory on the iPhone

- Starting points for performance
  - Load lazily
  - Don't leak
  - Watch your autorelease footprint
  - Reuse memory

# Memory on the iPhone

- Starting points for performance
  - Load lazily
  - Don't leak
  - Watch your autorelease footprint
  - Reuse memory
- System memory warnings are a last resort
  - Respond to warnings or be terminated

# Loading Lazily

- Pervasive in Cocoa frameworks
- Do only as much work as is required
  - Application launch time!
- Think about where your code **really** belongs
- Use multiple NIBs for your user interface

# Loading a Resource Too Early

# Loading a Resource Too Early

- What if it's not needed until much later? Or not at all?

```
- (id)init
{
    self = [super init];
    if (self) {
        // Too early...
        myImage = [self readSomeHugeImageFromDisk];
    }
    return self;
}
```

# Loading a Resource Lazily

# Loading a Resource Lazily

- Wait until someone actually requests it, then create it

```
- (UIImage *)myImage
{
    if (myImage == nil) {
        myImage = [self readSomeHugeImageFromDisk];
    }
}
```

# Loading a Resource Lazily

- Wait until someone actually requests it, then create it

```
- (UIImage *)myImage
{
    if (myImage == nil) {
        myImage = [self readSomeHugeImageFromDisk];
    }
}
```

- This pattern benefits **both** memory and launch time

# Loading a Resource Lazily

- Wait until someone actually requests it, then create it
  - (UIImage \*)myImage  
{  
    if (myImage == nil) {  
        myImage = [self readSomeHugeImageFromDisk];  
    }  
}
- This pattern benefits **both** memory and launch time
- Not always the right move, consider your specific situation

# Loading a Resource Lazily

- Wait until someone actually requests it, then create it
  - (UIImage \*)myImage  
{  
    if (myImage == nil) {  
        myImage = [self readSomeHugeImageFromDisk];  
    }  
}
- This pattern benefits **both** memory and launch time
- Not always the right move, consider your specific situation
- Notice that above implementation is **not thread-safe!**

# Plugging Leaks

# Plugging Leaks

- Memory leaks are very bad
  - Especially in code that runs often

# Plugging Leaks

- Memory leaks are very bad
  - Especially in code that runs often
- Luckily, leaks are **easy to find** with the right tools

# Method Naming and Object Ownership

# Method Naming and Object Ownership

- If a method's name contains **alloc**, **copy** or **new**, then it **returns a retained object**

# Method Naming and Object Ownership

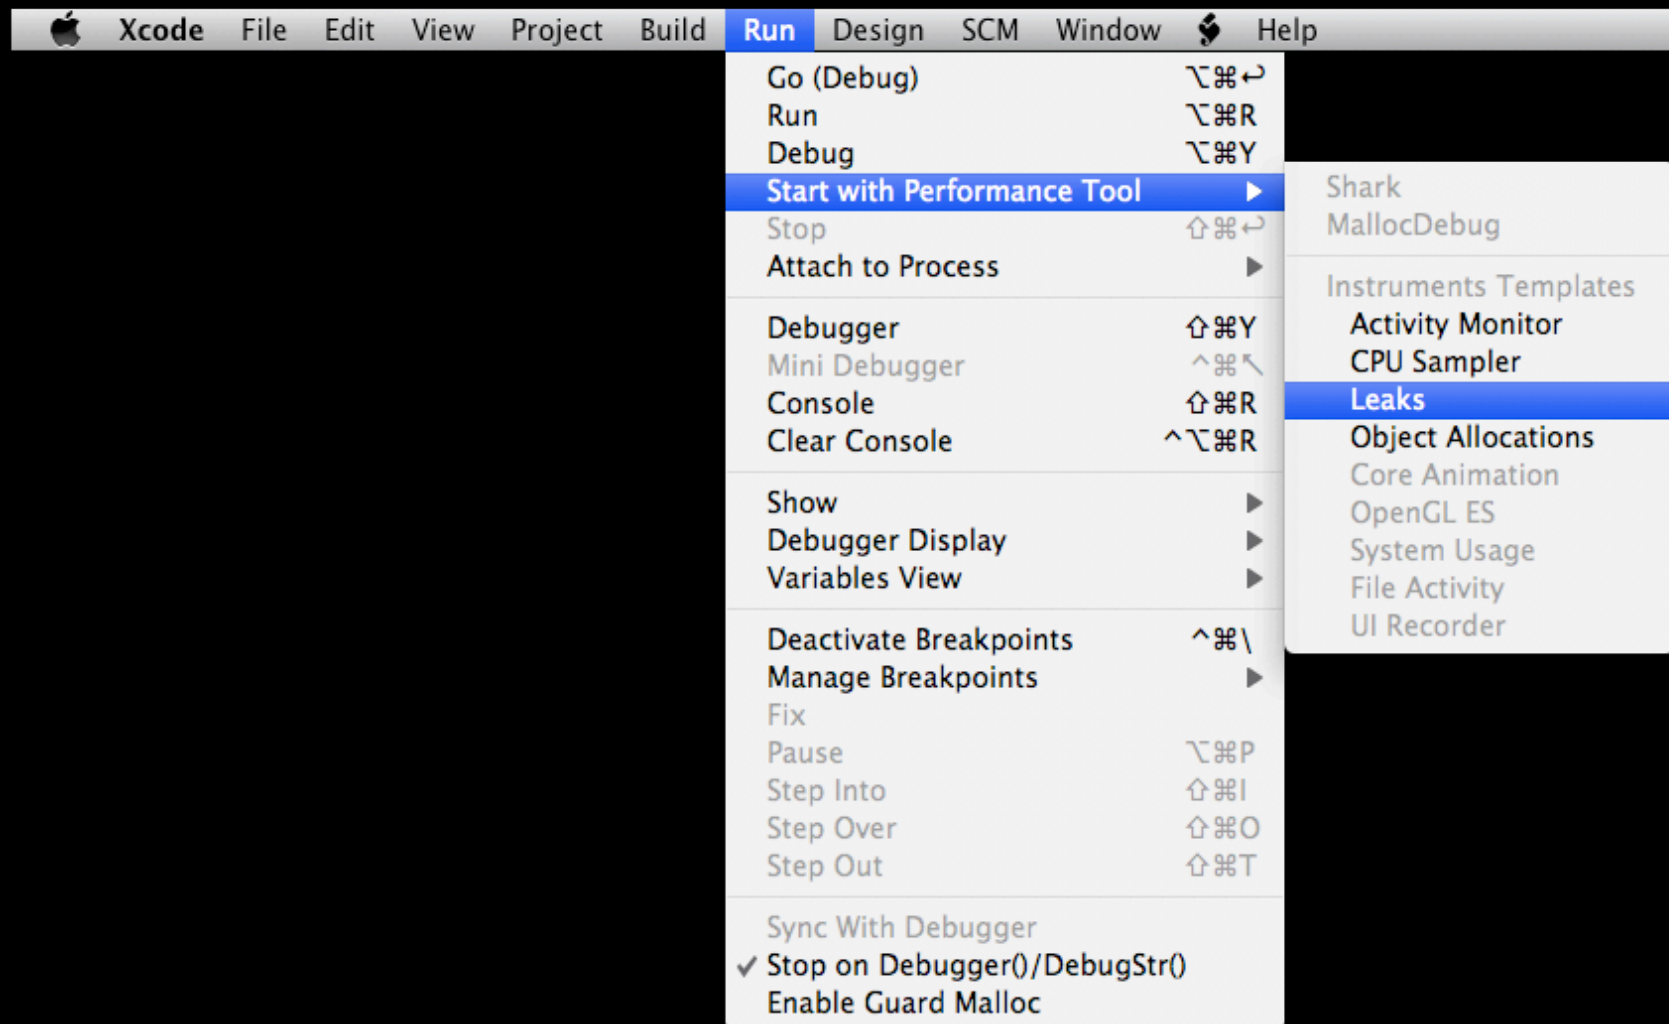

- If a method's name contains **alloc**, **copy** or **new**, then it **returns a retained object**
- Balance calls to **alloc**, **copy**, **new** or **retain** with calls to **release** or **autorelease**

# Method Naming and Object Ownership

- If a method's name contains **alloc**, **copy** or **new**, then it **returns a retained object**
- Balance calls to **alloc**, **copy**, **new** or **retain** with calls to **release** or **autorelease**
  - **Early returns** can make this very difficult to do!

# Finding Leaks

- Use **Instruments** with the **Leaks** recorder

# Identifying Leaks in Instruments

- Each leak comes with a backtrace
- Leaks in system code do exist, but they're rare
  - If you find one, tell us at <http://bugreport.apple.com>
- Consider your own application code first

# Caught in the Act

**Instruments1**

Record | Default Target: MyTableView | 00:00:24 | Run 1 of 1 | Inspection Range | Mini | View | Library

**Call Tree**

- ☐ Invert Call Tree
- ☐ Hide Missing Symbols
- ☐ Hide System Libraries
- ☐ Show Obj-C Only
- ☐ Flatten Recursion

Leaked Blocks | Q- Instrument Detail

# Demo: Finding Leaks with Instruments

# Autorelease and You

# Autorelease and You

- Autorelease **simplifies your code**
  - Worry less about the scope and lifetime of objects

# Autorelease and You

- Autorelease **simplifies your code**
  - Worry less about the scope and lifetime of objects
- When an autorelease pool is drained, it calls -release on each object

# Autorelease and You

- Autorelease **simplifies your code**
  - Worry less about the scope and lifetime of objects
- When an autorelease pool is drained, it calls -release on each object
- An autorelease pool is created automatically for each iteration of your application's run loop

# So What's the Catch?

- What if many objects are autoreleased before the pool pops?
- Consider the **maximum memory footprint** of your application

# A Crowded Pool...

# Reducing Your High-Water Mark

# Reducing Your High-Water Mark

- When many objects will be autoreleased, **create and release your own pool**

# Reducing Your High-Water Mark

- When many objects will be autoreleased, **create and release your own pool**
  - Usually not necessary, don't do this without thinking!

# Reducing Your High-Water Mark

- When many objects will be autoreleased, **create and release your own pool**
  - Usually not necessary, don't do this without thinking!
  - Tools can help identify cases where it's needed

# Reducing Your High-Water Mark

- When many objects will be autoreleased, **create and release your own pool**
  - Usually not necessary, don't do this without thinking!
  - Tools can help identify cases where it's needed
  - **Loops** are the classic case

# Autorelease in a Loop

- Remember that many methods return autoreleased objects

# Autorelease in a Loop

- Remember that many methods return autoreleased objects

```
for (int i = 0; i < someLargeNumber; i++) {  
    NSString *string = ...;  
    string = [string lowercaseString];  
    string = [string stringByAppendingString:...];  
    NSLog(@"%@", string);  
}
```

# Creating an Autorelease Pool

- One option is to create and release for each iteration

# Creating an Autorelease Pool

- One option is to create and release for each iteration

```
for (int i = 0; i < someLargeNumber; i++) {  
    NSAutoreleasePool *pool = [[NSAutoreleasePool alloc] init];  
  
    NSString *string = ...;  
    string = [string lowercaseString];  
    string = [string stringByAppendingString:...];  
    NSLog(@"%@", string);  
  
    [pool release];  
}
```

# Outliving the Autorelease Pool

- What if some object is needed outside the scope of the pool?

# Outliving the Autorelease Pool

- What if some object is needed outside the scope of the pool?

```
NSString *stringToReturn = nil;
```

```
for (int i = 0; i < someLargeNumber; i++) {  
    NSAutoreleasePool *pool = [[NSAutoreleasePool alloc] init];
```

```
    NSString *string = ...;  
    string = [string stringByAppendingString:...];
```

```
    if ([string someCondition]) {  
        stringToReturn = [string retain];  
    }
```

```
    [pool release];  
    if (stringToReturn) break;  
}
```

```
return [stringToReturn autorelease];
```

# Reducing Use of Autorelease

- Another option is to cut down on use of autoreleased objects
  - Not always possible if you're calling into someone else's code
- When it makes sense, switch to alloc/init/release
- In previous example, perhaps use a single NSMutableString?

# Demo:

# Measuring Your High-Water Mark

# Object Creation Overhead

- **Most of the time**, creating and deallocating objects is **not** a insignificant hit to application performance
- In a tight loop, though, it can become a problem...

# Object Creation Overhead

- **Most of the time**, creating and deallocating objects is **not** a insignificant hit to application performance
- In a tight loop, though, it can become a problem...

```
for (int i = 0; i < someLargeNumber; i++) {  
    MyObject *object = [[MyObject alloc] initWithValue:...];  
    [object doSomething];  
    [object release];  
}
```

# Reusing Objects

# Reusing Objects

- Update existing objects rather than creating new ones

# Reusing Objects

- Update existing objects rather than creating new ones
- Combine **intuition** and **evidence** to decide if it's necessary

```
MyObject *myObject = [[MyObject alloc] init];
```

```
for (int i = 0; i < someLargeNumber; i++) {  
    myObject.value = ...;  
    [myObject doSomething];  
}
```

```
[myObject release];
```

# Reusing Objects

- Update existing objects rather than creating new ones
- Combine **intuition** and **evidence** to decide if it's necessary

```
MyObject *myObject = [[MyObject alloc] init];
```

```
for (int i = 0; i < someLargeNumber; i++) {  
    myObject.value = ...;  
    [myObject doSomething];  
}
```

```
[myObject release];
```

- Remember `-[UITableView dequeueReusableCellWithIdentifier]`

# Memory Warnings

# Memory Warnings

- Coexist with system applications

# Memory Warnings

- Coexist with system applications
- Memory warnings issued when memory runs out

# Memory Warnings

- Coexist with system applications
- Memory warnings issued when memory runs out
- Respond to memory warnings or **face dire consequences!**

# Memory Warnings

- Coexist with system applications
- Memory warnings issued when memory runs out
- Respond to memory warnings or **face dire consequences!**

# Memory Warnings

- Coexist with system applications
- Memory warnings issued when memory runs out
- Respond to memory warnings or **face dire consequences!**

# Responding to Memory Warnings

- Every view controller gets `-didReceiveMemoryWarning`
  - By default, releases the view if it's not visible
  - Release other expensive resources in your subclass

# Responding to Memory Warnings

- Every view controller gets `-didReceiveMemoryWarning`
  - By default, releases the view if it's not visible
  - Release other expensive resources in your subclass

```
- (void)didReceiveMemoryWarning
{
    // Always call super
    [super didReceiveMemoryWarning];

    // Release expensive resources
    [expensiveResource release];
    expensiveResource = nil;
}
```

# Responding to Memory Warnings

- Every view controller gets -didReceiveMemoryWarning
  - By default, releases the view if it's not visible
  - Release other expensive resources in your subclass

```
- (void)didReceiveMemoryWarning
{
    // Always call super
    [super didReceiveMemoryWarning];

    // Release expensive resources
    [expensiveResource release];
    expensiveResource = nil;
}
```

- App Delegate gets -applicationDidReceiveMemoryWarning:

# What Other Resources Do I Release?

- Images
- Sounds
- Cached data

# What Other Resources Do I Release?

- Images
- Sounds
- Cached data

# Use SQLite/Core Data for Large Data Sets

- Many data formats keep everything in memory
- SQLite can work with your data in chunks

# More on Memory Performance

- “Memory Usage Performance Guidelines”  
<https://developer.apple.com/iphone/library/documentation/Performance/Conceptual/ManagingMemory/>

# Concurrency

# Why Concurrency?

- With a single thread, long-running operations may interfere with user interaction
- Multiple threads allow you to load resources or perform computations without locking up your entire application

# Threads on the iPhone

- Based on the POSIX threading API
  - `/usr/include/pthread.h`
- Higher-level wrappers in the Foundation framework

# NSThread Basics

- Run loop automatically instantiated for each thread
- Each NSThread needs to create its own autorelease pool
- Convenience methods for messaging between threads

# Typical NSThread Use Case

# Typical NSThread Use Case

```
- (void)someAction:(id)sender
{
    // Fire up a new thread
    [NSThread detachNewThreadSelector:@selector(doWork:)
                withTarget:self object:someData];
}
```

# Typical NSThread Use Case

```
- (void)someAction:(id)sender
{
    // Fire up a new thread
    [NSThread detachNewThreadSelector:@selector(doWork:)
                withTarget:self object:someData];
}

- (void)doWork:(id)someData
{
    NSAutoreleasePool *pool = [[NSAutoreleasePool alloc] init];

    [someData doLotsOfWork];

    // Message back to the main thread
    [self performSelectorOnMainThread:@selector(allDone:)
        withObject:[someData result] waitUntilDone:NO];

    [pool release];
}
```

# UIKit and Threads

- Unless otherwise noted, UIKit classes are **not threadsafe**
  - Objects must be created and messaged from the main thread
- You **can** create a UIImage on a background thread
  - But you **can't** set it on a UIImageView

# Demo: Threads and Xcode

# Locks

- Protect critical sections of code, mediate access to shared data
- NSLock and subclasses

# Locks

- Protect critical sections of code, mediate access to shared data
- NSLock and subclasses

```
- (void)init
{
    myLock = [[NSLock alloc] init];
}

- (void)someMethod
{
    [myLock lock];
    // We only want one thread executing this code at once
    [myLock unlock]
}
```

# Conditions

# Conditions

- NSCondition is useful for producer/consumer model

# Conditions

- NSCondition is useful for producer/consumer model

```
// On the producer thread
- (void)produceData
{
    [condition lock];

    // Produce new data
    newDataExists = YES;

    [condition signal];
    [condition unlock];
}
```

# Conditions

- NSCondition is useful for producer/consumer model

```
// On the producer thread
- (void)produceData
{
    [condition lock];

    // Produce new data
    newDataExists = YES;

    [condition signal];
    [condition unlock];
}
```

```
// On the consumer thread
- (void)consumeData
{
    [condition lock];
    while(!newDataExists) {
        [condition wait];
    }

    // Consume the new data
    newDataExists = NO;

    [condition unlock];
}
```

# Conditions

- NSCondition is useful for producer/consumer model

```
// On the producer thread
- (void)produceData
{
    [condition lock];

    // Produce new data
    newDataExists = YES;

    [condition signal];
    [condition unlock];
}
```

```
// On the consumer thread
- (void)consumeData
{
    [condition lock];
    while(!newDataExists) {
        [condition wait];
    }

    // Consume the new data
    newDataExists = NO;

    [condition unlock];
}
```

- **Wait** is equivalent to: **unlock**, **sleep** until signalled, **lock**

# The Danger of Locks

- **Very difficult** to get locking right!
- All it takes is one poorly behaved client
  - Accessing shared data outside of a lock
  - Deadlocks
  - Priority inversion

# Threading Pitfalls

# Threading Pitfalls

- Subtle, **nondeterministic bugs** may be introduced

# Threading Pitfalls

- Subtle, **nondeterministic bugs** may be introduced
- Code may become **more difficult to maintain**

# Threading Pitfalls

- Subtle, **nondeterministic bugs** may be introduced
- Code may become **more difficult to maintain**
- In the worst case, more threads can mean **slower code**

# Alternatives to Threading

# Alternatives to Threading

- Asynchronous (nonblocking) functions
  - Specify target/action or delegate for callback
  - **NSURLConnection** has synchronous and asynchronous variants

# Alternatives to Threading

- Asynchronous (nonblocking) functions
  - Specify target/action or delegate for callback
  - **NSURLConnection** has synchronous and asynchronous variants
- Timers
  - One-shot or recurring
  - Specify a callback method
  - Managed by the run loop

# Alternatives to Threading

- Asynchronous (nonblocking) functions
  - Specify target/action or delegate for callback
  - **NSURLConnection** has synchronous and asynchronous variants
- Timers
  - One-shot or recurring
  - Specify a callback method
  - Managed by the run loop
- Higher level constructs like **operations**

# NSOperation

- Abstract superclass
- Manages thread creation and lifecycle
- Encapsulate a **unit of work** in an object
- Specify priorities and dependencies

# Creating an NSOperation Subclass

# Creating an NSOperation Subclass

- Define a **custom init method**

```
- (id)initWithSomeObject:(id)someObject
{
    self = [super init];
    if (self) {
        self.someObject = someObject;
    }
    return self;
}
```

# Creating an NSOperation Subclass

- Define a **custom init method**

```
- (id)initWithSomeObject:(id)someObject
{
    self = [super init];
    if (self) {
        self.someObject = someObject;
    }
    return self;
}
```

- **Override -main method** to do work

```
- (void)main
{
    [someObject doLotsOfTimeConsumingWork];
}
```

# NSOperationQueue

- Operations are typically scheduled by **adding to a queue**
- Choose a maximum number of concurrent operations
- Queue runs operations based on priority and dependencies

# Using an NSInvocationOperation

- Concrete subclass of NSOperation
- For lightweight tasks where creating a subclass is overkill

# Using an NSInvocationOperation

- Concrete subclass of NSOperation
- For lightweight tasks where creating a subclass is overkill

```
- (void)someAction:(id)sender
{
    NSInvocationOperation *operation =
        [[NSInvocationOperation alloc] initWithTarget:self
                                                selector:@selector(doWork:)
                                                object:someObject];

    [queue addObject:operation];

    [operation release];
}
```

# Demo: Threaded Flickr Loading

# More on Concurrent Programming

- “Threading Programming Guide”  
<https://developer.apple.com/iphone/library/documentation/Cocoa/Conceptual/Multithreading>

# Additional Tips & Tricks

# Drawing Performance

- Avoid transparency when possible
  - Opaque views are much faster to draw than transparent views
  - Especially important when scrolling
- Don't call `-drawRect: yourself`
- Use `-setNeedsDisplayInRect:` instead of `-setNeedsDisplay`
- Use CoreAnimation Instrument

# Reuse Table View Cells

- UITableView provides mechanism for reusing table view cells

# Reuse Table View Cells

- UITableView provides mechanism for reusing table view cells

```
- (UITableViewCell *)tableView:(UITableView *)tableView  
cellForRowAtIndexPath:(NSIndexPath *)indexPath  
{
```

```
    return cell;  
}
```

# Reuse Table View Cells

- UITableView provides mechanism for reusing table view cells
  - (UITableViewCell \*)tableView:(UITableView \*)tableView  
cellForRowAtIndexPath:(NSIndexPath \*)indexPath  
{  
    // Ask the table view if it has a cell we can reuse  
    UITableViewCell \*cell =  
    [tableView dequeueReusableCellWithIdentifier:MyIdentifier];  
  
    return cell;  
}

# Reuse Table View Cells

- UITableView provides mechanism for reusing table view cells
  - (UITableViewCell \*)tableView:(UITableView \*)tableView  
cellForRowAtIndexPath:(NSIndexPath \*)indexPath  
{  
    // Ask the table view if it has a cell we can reuse  
    UITableViewCell \*cell =  
    [tableView dequeueReusableCellWithIdentifier:MyIdentifier];  
  
    if (!cell) { // If not, create one with our identifier  
        cell = [[UITableViewCell alloc] initWithFrame:CGRectZero  
  identifier:MyIdentifier];  
        [cell autorelease];  
    }  
  
    return cell;  
}

# Get notified

- Don't continuously poll!
  - Unless you must, which is rare
- Hurts both responsiveness and battery life
- Look in the documentation for a notification, delegate callback or other asynchronous API

# Take Samples

- Instrument that lets you monitor CPU usage
- Backtrace taken every fraction of a second
- Higher samples = better candidates for optimization

# Recap

- Performance is an art and a science
  - Combine tools & concrete data with intuition & best practices
- Don't waste memory
- Concurrency is tricky, abstract it if possible
- Drawing is expensive, avoid unnecessary work

# Questions?
