Human visual perception - topics

- Visual acuity
- Weber-Fechner Law
- Lateral inhibition and excitation
- Transfer functions of the color channels
- Spatial and temporal masking
- Eye movements

Anatomy of the human eye

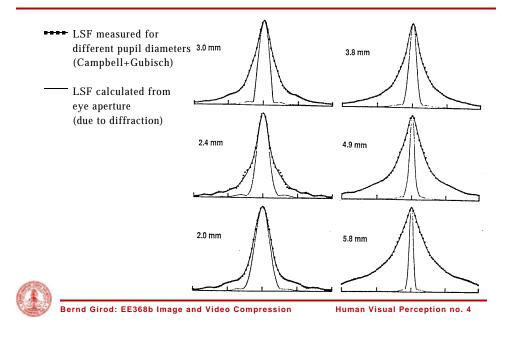

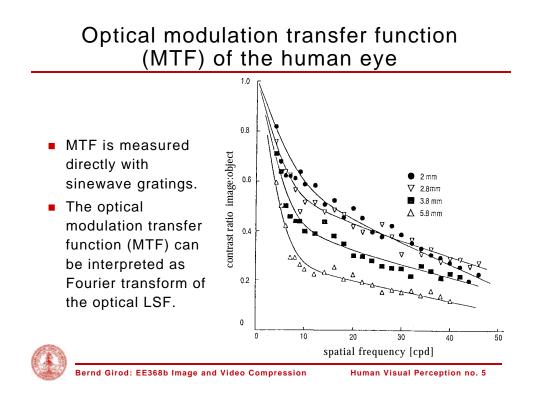

Optical properties of the human eye

- Deviations from ideal perspective projection due to
 - Aperture of the eye
 - Focus errors (spherical aberration)
 - Chromatic aberration
 - Dispersion
- Effects can be summarized by a 2D convolution with the optical point-spread function (PSF).
- Instead of a PSF, an optical line-spread function (LSF) is often given, which can be measured more easily.

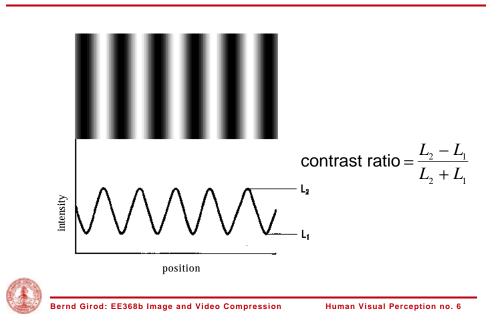

Bernd Girod: EE368b Image and Video Compression Human Visual Perception no. 3

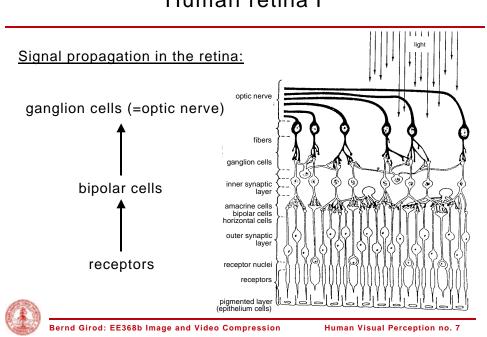

Optical LSF of the human eye

Sine wave grating

Human retina I

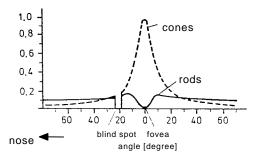

Human retina II

		receptors in 1000/mm ²
Rods	Cones	
high sensitivity low light vision monochrome "scotopic vision"	low sensitivity day light vision > 1 cd/m ² color "photopic vision"	100 rods
	T Video displays	iso ko żo żo żo ko ko ko blind spot fovea nose ← angle [degree]
(III)		

Bernd Girod: EE368b Image and Video Compression

Human Visual Perception no. 8

• Spatial resolution in lines/arcmin:

 Minimum distance of adjacent cones in the central fovea limits spatial resolution. (2 - 2.3 μm +> 25 ... 29 sec of arc)

Weber-Fechner law, I

Experiment: Result: 10 threshold ΔL in cd/m² surround luminance L_s background =1570cd/n luminance L_B stimulus 1 area La= CONST 0,1 100 10 1000 L_B , background luminance (cd/m²) Bernd Girod: EE368b Image and Video Compression Human Visual Perception no. 10

"Weber-Fechner Law"

 $\Delta L = cL_B \qquad c = 0.01 \dots 0.02$

- Implies logarithmic relationship between physical luminance and subjectively perceived brightness.
- Other proposed nonlinearities: square-root, cube-root, polynomials
- γ-characteristic of CRT displays is approximate inverse of nonlinearity of human brightness perception.

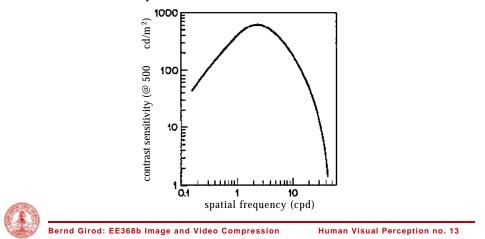

Inhibition and excitation in the retina

- Receptive field of a ganglion cell (=fiber of the optic nerve) shows "center-surround response" with both
 - Lateral inhibition
 - Lateral excitation

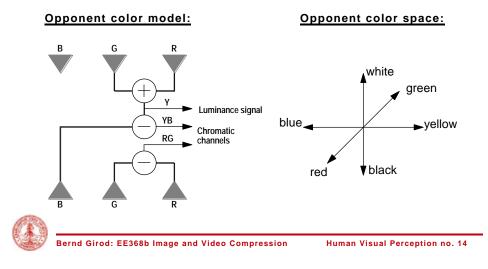

Spatial contrast sensitivity

 Lateral inhibition and excitation together lead to a bandpass characteristic of the contrast sensitivity function of the human visual system

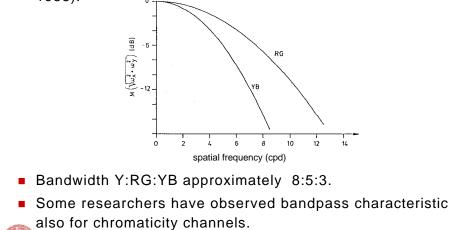

Color vision: opponent color theory

 Retina carries out "matrix operation" to represent colors in the opponent color system (Y, Y-B, R-G)

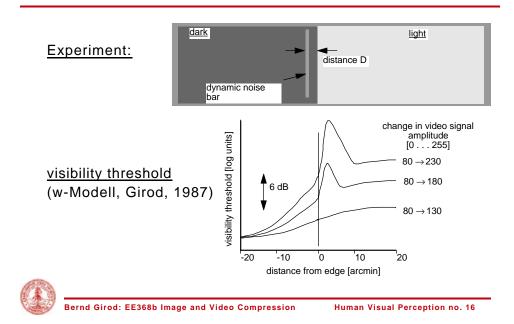

Color vision: contrast sensitivity in opponent color space

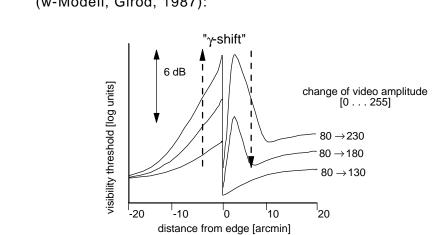

Spatial frequency response of Y-B and R-G channel (Girod, 1988):

also for chromaticity channels.
Bernd Girod: EE368b Image and Video Compression Human Visual Perception no. 15

Spatial masking, I

Visibility threshold for the γ -predistorted video signal (w-Modell, Girod, 1987):

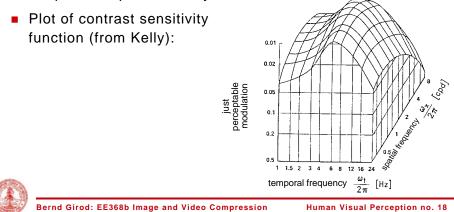

Spatiotemporal contrast sensitivity of luminance perception

Human Visual Perception no. 17

 Spatiotemporal contrast sensitivity of the luminance channel has bandpass characteristic.

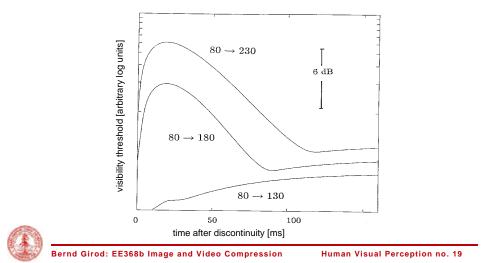

Bernd Girod: EE368b Image and Video Compression

 Contrast sensitivity function separable for high spatial and temporal frequencies only.

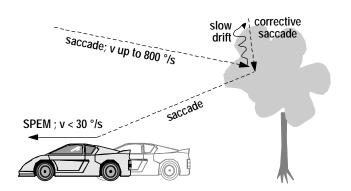

Temporal masking

 Visibility thresholds for γ-predistorted video signal after luminance discontinuity (w-model, Girod, 1987):

Eye movements

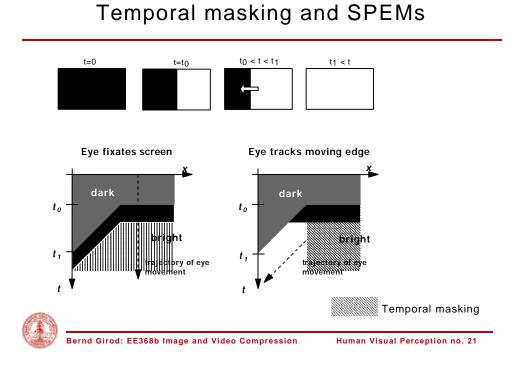

SPEM: smooth pursuit eye movement

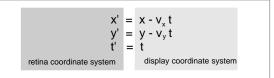

Bernd Girod: EE368b Image and Video Compression

Human Visual Perception no. 20

Eye movements and spatiotemporal frequency response of the human visual system, I

Assume SPEM of constant velocity:

 Coordinate transformation in spatiotemporal frequency space ("Doppler effect")

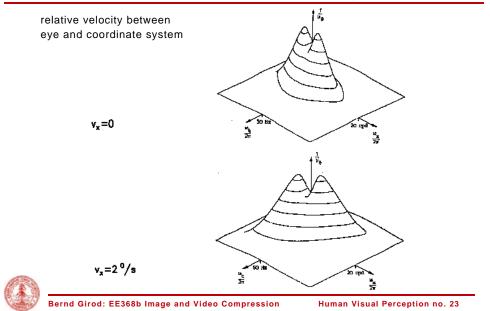

```
 \begin{split} & \boldsymbol{\omega}_x{}' \;=\; \boldsymbol{\omega}_x \\ & \boldsymbol{\omega}_y{}' \;=\; \boldsymbol{\omega}_y \\ & \boldsymbol{\omega}_t{}' \;=\; \boldsymbol{\omega}_t \;\; + \; \boldsymbol{\omega}_x{}\; \boldsymbol{v}_x \;\; + \; \boldsymbol{\omega}_y{}\; \boldsymbol{v}_y \end{split}
```

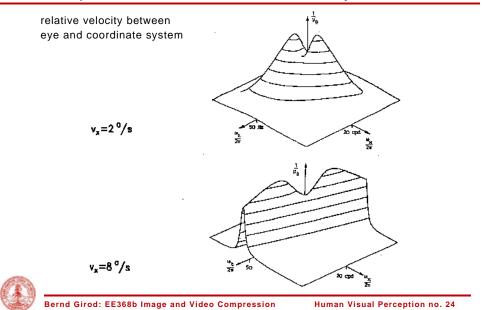

Bernd Girod: EE368b Image and Video Compression

Human Visual Perception no. 22

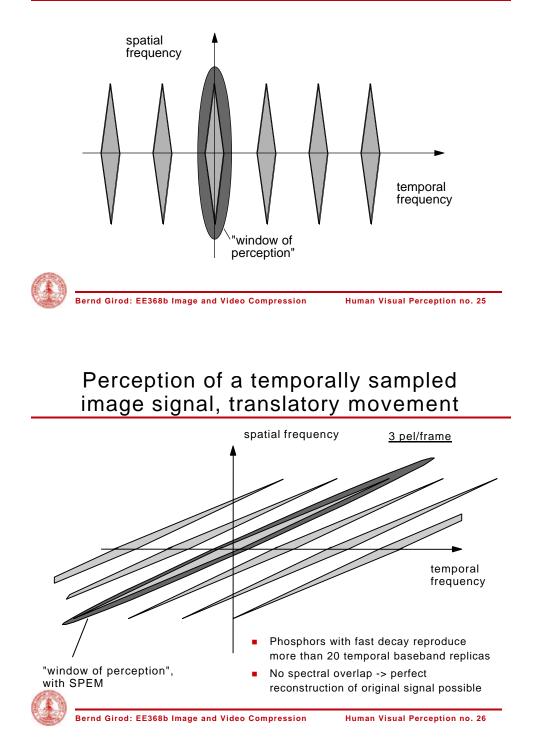

Eye movements and spatiotemporal frequency response of the human visual system, II

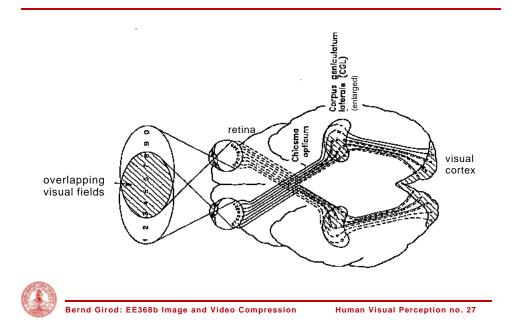

Eye movements and spatiotemporal frequency response of the human visual system, III

Perception of a temporally sampled image signal, without movement

Anatomy of the human visual system

Human visual perception - summary

- Spatial frequency components visible up to 60 cpd
- Logarithmic relationship between luminance and subjective brightness perception
- Lateral inhibition -> spatial bandpass characteristic
- Chromaticity channels have lower bandwidth
- Visibility threshold often increased in the vicinity of edges, but sometimes decreased ("masking").
- SPEMs shear window of perception in spatiotemporal frequency space.
