

Infield Hits

A photograph of a baseball game in progress. A runner in a grey uniform is sliding into a base. A fielder in a white uniform with a red cap is reaching out with his glove to catch the ball. The ball is in the air near the fielder's glove. The scene is set on a baseball field with green grass and brown dirt.

Parker Phillips
Harry Simon

What is an infield hit?

AN INFIELD HIT IS A BASE HIT ON A BALL THAT DOES NOT LEAVE THE INFIELD

Positives:

- Single.
- Not an Out
- Extends Your Teams Offense

Negatives:

- Not a very Productive Hit
- Hard to generate an Runs

Our Questions

- ▶ Are infield hits becoming more prevalent in baseball?
- ▶ What is causing there to be more infield hits?
- ▶ Is there any significance to more infield hits?
- ▶ Can we use infield hits to predict the value of a player?
- ▶ Can we use infield hits to predict the speed of a player?

Methods

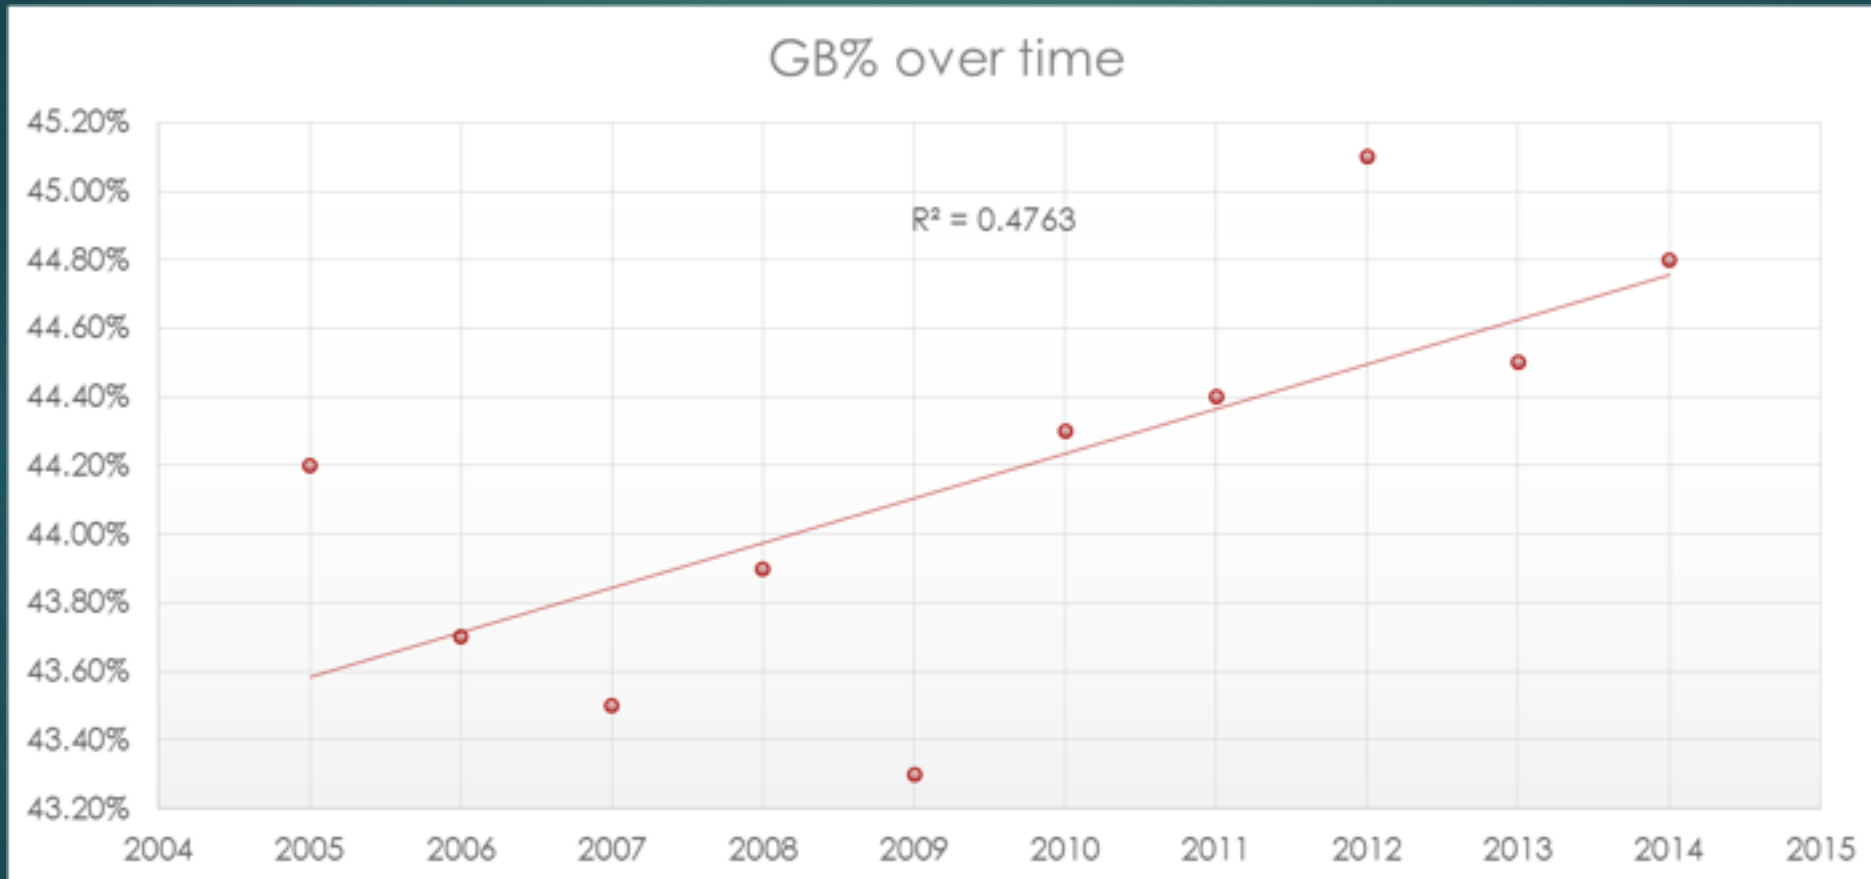

- ▶ Analyzed Tables from Fangraphs that dealt with Infield Hits, and Similar Statistics.
- ▶ Created New Statistics to Reveal the Significance of Infield Hits
- ▶ Analyzed Center Fielders as a Representative of Speedy Players with a Minimum of 10 Stolen Base Attempts.
- ▶ Created a New Speed Statistic using IFH% and compared it to the old Speed Statistic

Infield hit percentage over time

IFH% = Infield Hits/Ground Balls

Also increasing over time

What we looked at

Pitching

Improved Pitching might imply more infield hits.

Speed

If players are getting faster, they may be more capable of running out infield singles than they were in the past

Defense

If overall defense was on the decline, it is possible that hitters have a higher probability of reaching safely on a ball hit to the infield.

*There is no infield hits against statistic, which made this a dead end to follow. It would be interesting in a later report though.

Negative ERA over time

ERA and Infield Hits

Infield Hits versus Negative ERA

Is IFH% an Important Statistic?

- ▶ Compared to WAR
 - ▶ WAR is generally a very acceptable metric for measuring the usefulness of a player
- ▶ Better at predicting WAR than other popular statistics.
- ▶ Combining Statistics with IFH% to better predict WAR

IFH% is pretty bad at predicting WAR

R^2 Values

Average	SLG%	GB%	LD%	IFH%
.0019	.4029	.0053	.02	.0165

IFH% is pretty bad at predicting WAR by itself

What Makes Trout so Good?

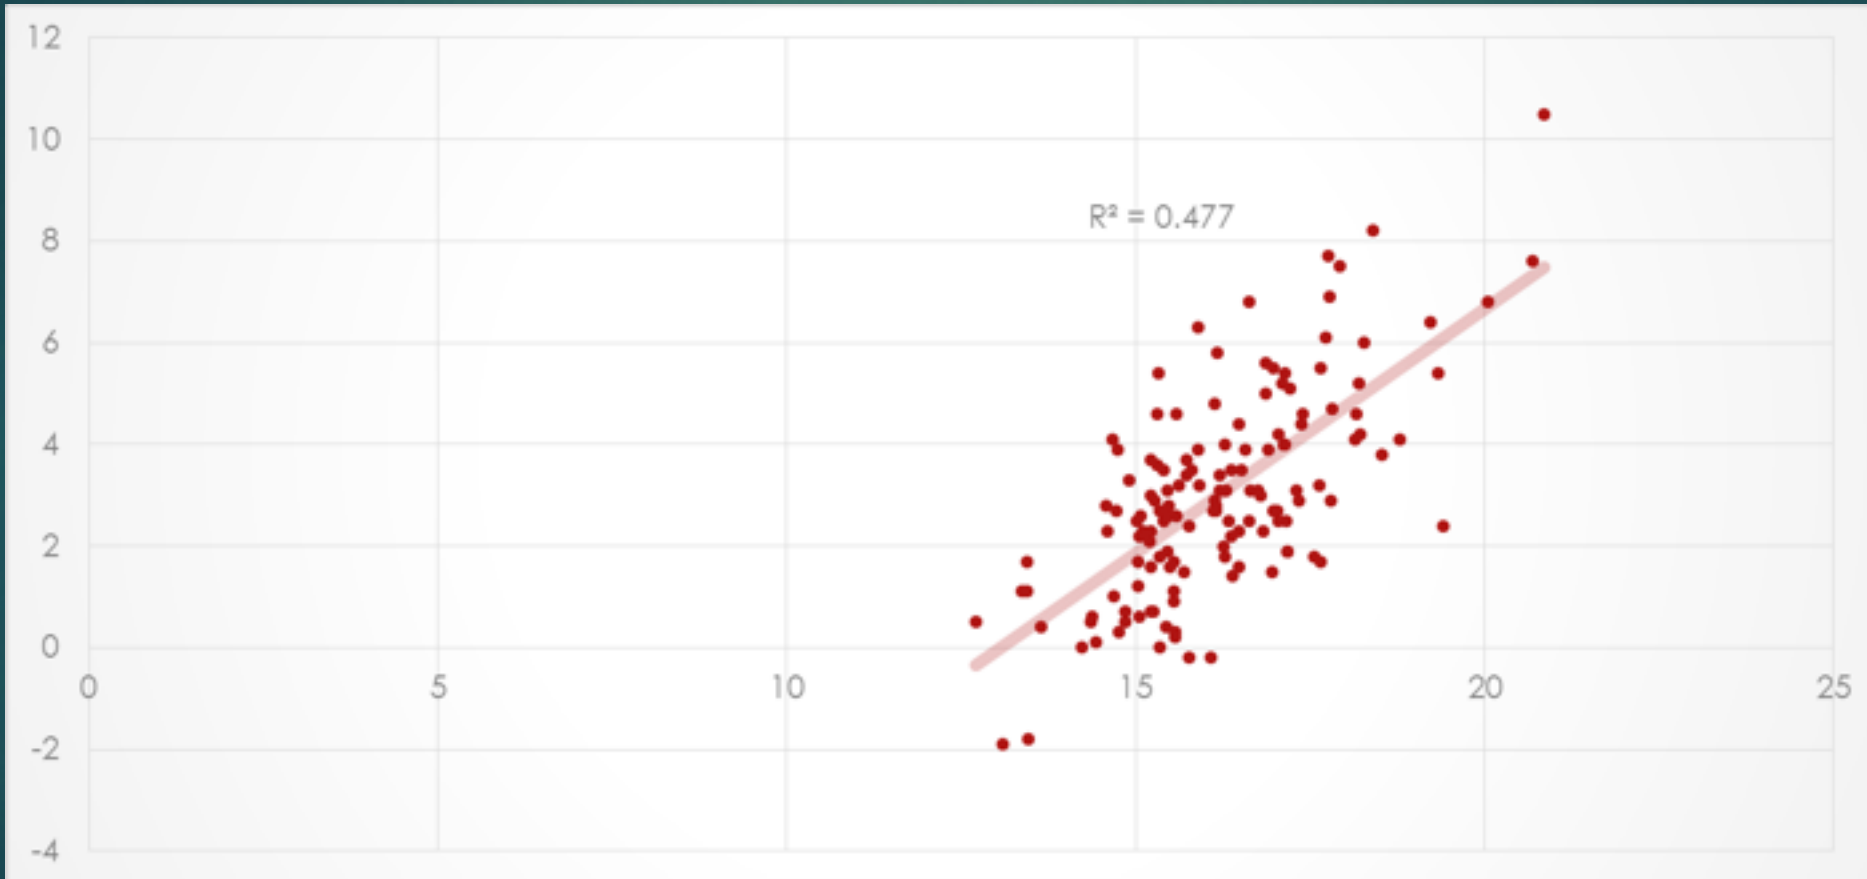

SLG% + IFH%

Although not good, it is better predictor of WAR than either

Combine More

$$A * SLG\% + B * GB\% + C * LD\% + D * IFH\%$$

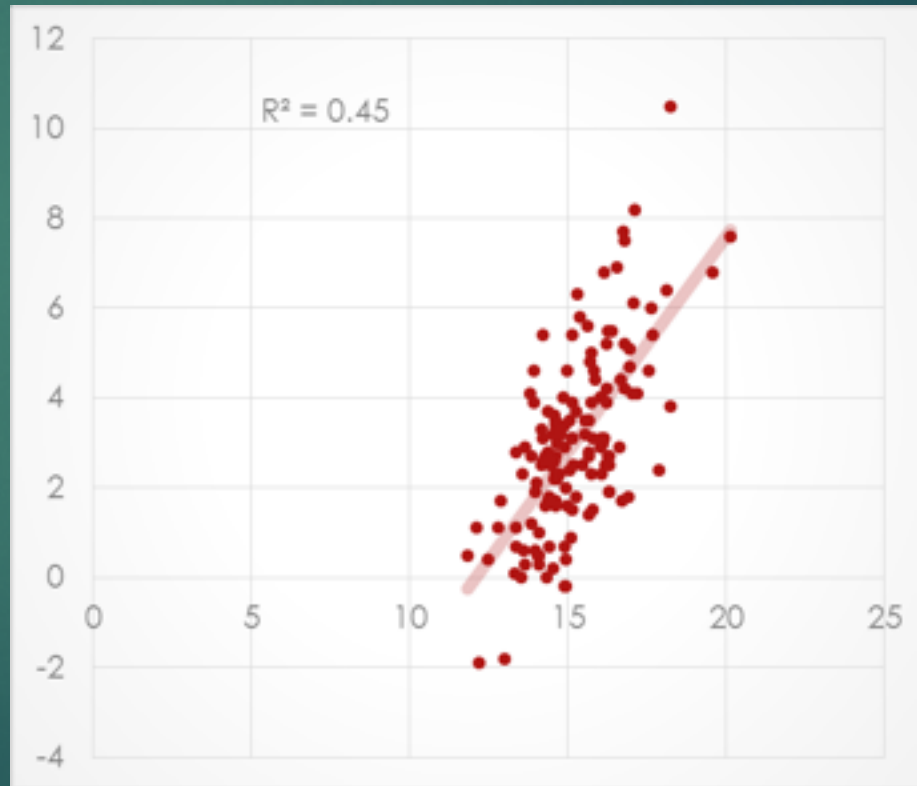

With and Without IFH%

New Stat

New Stat – IFH%

Significance

- ▶ Although IFH% is not very good at telling us if a player is good or not, if we combine IFH% with other statistics, we can get a lot more information out of it.

Example

Chris Davis

- ▶ SLG% = .634
- ▶ IFH% = 3.10
- ▶ WAR = 6.8

Andrew McCutchen

- ▶ SLG% = .508
- ▶ IFH% = 8.1
- ▶ WAR = 8.2

SPEED

SPD

A STATISTIC DEVELOPED BY BILL JAMES THAT RATES A PLAYER ON THEIR SPEED AND BASE RUNNING ABILITY. CALCULATED BY COMBINING STOLEN BASE PERCENTAGE, FREQUENCY OF STOLEN BASE ATTEMPTS, PERCENTAGE OF TRIPLES, AND RUNS SCORED PERCENTAGE. HOWEVER, IT DOES NOT TAKE INTO ACCOUNT IFH%

NEWSPEED

A STATISTIC WE CREATED THAT INCORPORATES IFH% INTO IT. IT IS CALCULATED USING BASE RUNNING VALUE, STOLEN BASE %, AND TRIPLES.

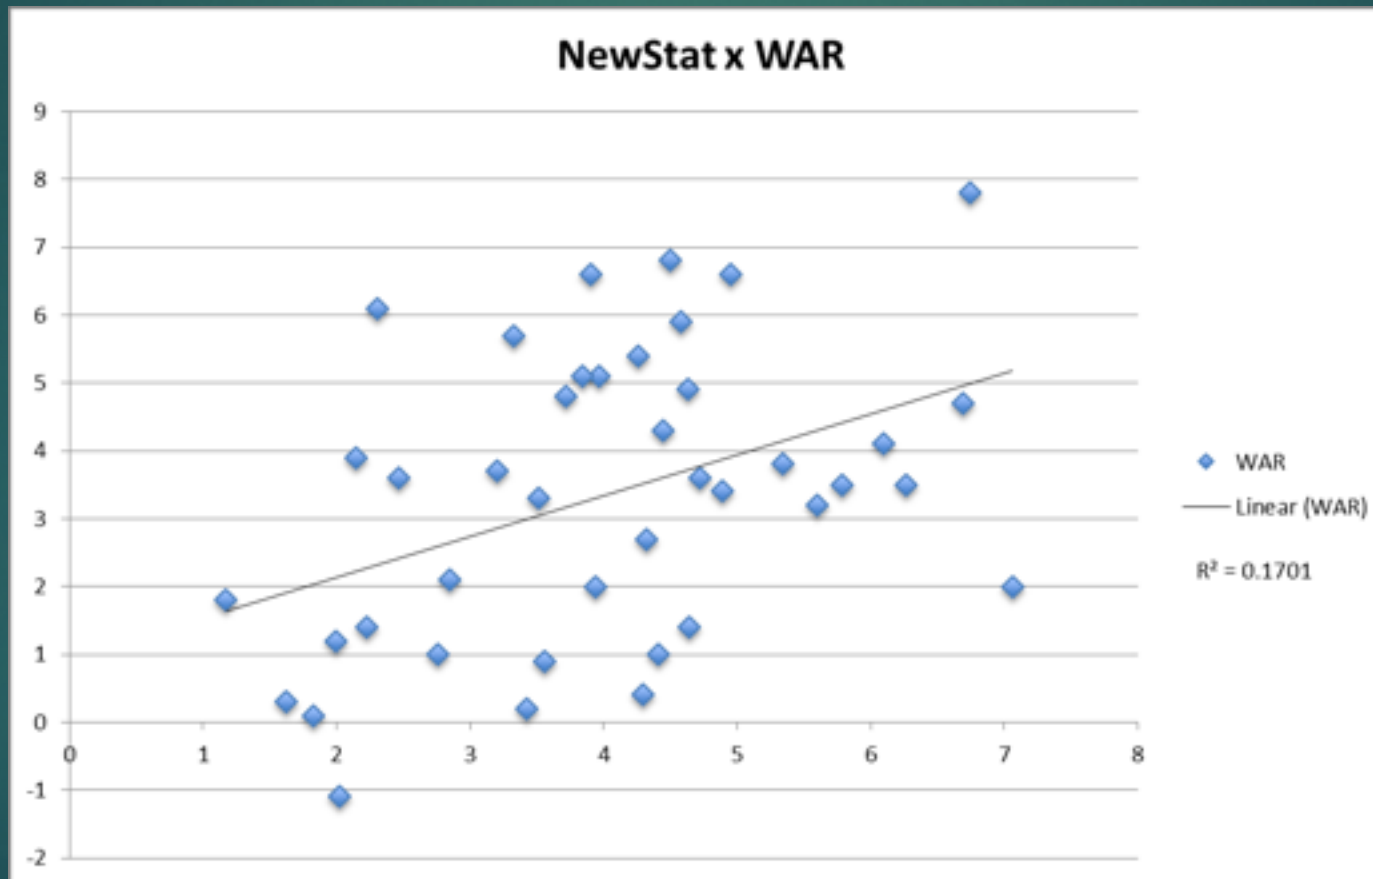

IFH% - Offense

SpD x WAR

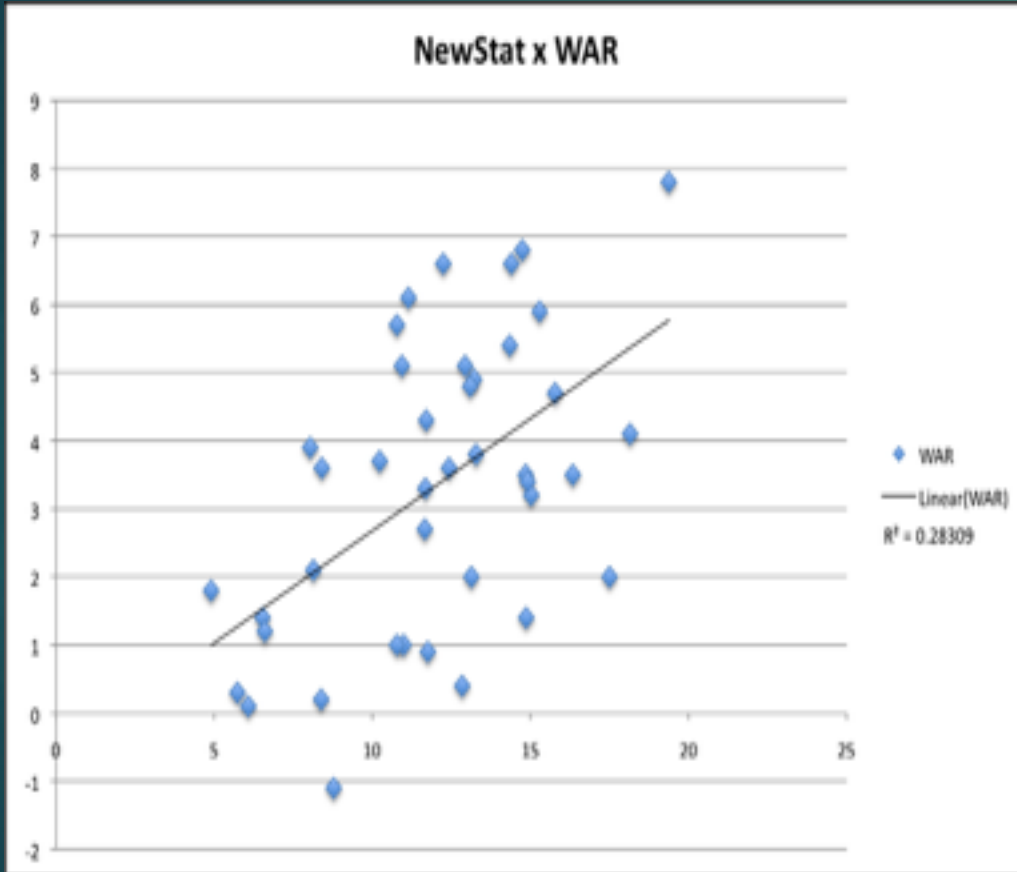

Unweighted

Weighted

NewStat compared to NewStat without IFH%

Compare two “Speedy” Players

Player	Offense	BaseRunning	IFH	IFH%	SB	SB%	3B	Spd	NewSpeed
<i>Starling Marte</i>	25.3	5.8	24	14.5%	30	73.2%	6	7.1	6.09
<i>Carlos Gomez</i>	26.8	3.3	20	12.7%	34	73.9%	4	6.5	4.58
<i>Who wins?</i>	C.G.	S.M.	S.M.	S.M.	C.G.	S.M.	S.M.	S.M.	S.M

Comparison of the Top 5 Players

Top 5 Players	SPD	NewSpeed	NewSpeed Minus	WAR
Ben Revere	7.2	7.06171621	6.12817774	2
Mike Trout	7	6.74042694	4.73458079	7.8
Hunter Pence	6.4	6.69440858	5.4454855	4.7
Billy Hamilton	7.7	6.26875224	4.85582917	3.5
Starling Marte	7.1	6.09299171	4.26376094	4.1

Conclusion

- ▶ Infield hits have become more prevalent in major league baseball since 2005.
- ▶ Improved pitching could be prevailing factor in causing this increase in prevalence.
- ▶ Although IFH% itself cannot predict WAR, when added to other statistics, it becomes more useful.
- ▶ IFH% is a good statistic to use to calculate the speed of a player
