

The Objectives for Implementing an Internal Carbon Charge at a Major Research University

Frank A. Wolak
 Director, Program on Energy and Sustainable Development
 Professor, Department of Economics
 Stanford University
 wolak@zia.stanford.edu
<http://www.stanford.edu/~wolak>

Goal of University Carbon Charge

- The goal of climate policy is a “credible and predictable price of carbon into the distant future”
- Given the magnitude of investments needed to address the greenhouse gas (GHG) emissions problem, solutions must come from private sector
- Private sector investment responds to price signals
 - A stable and predictable GHG emissions forward price curve will give private investors the confidence to invest in GHG control technologies
 - Investment in GHG control technology eliminates need to pay a GHG charge to emit over life of investment
 - Uncertain GHG charge dulls incentive to invest

Why Is a Stanford Professor at Yale?

Stanford's choice

By Frank A. Wolak
Last week, Stanford's Board of Trustees announced that it is choosing a new director of the Program on Energy and Sustainable Development. The search committee has selected Frank A. Wolak, a professor of economics at Stanford University, to lead the program. Wolak is a leading expert on energy policy and has been a member of the search committee. He is also a member of the search committee for the position of director of the Program on Energy and Sustainable Development. Wolak is a leading expert on energy policy and has been a member of the search committee. He is also a member of the search committee for the position of director of the Program on Energy and Sustainable Development.

Instead of not investing in coal, how about a revenue-neutral carbon tax?

There are many important choices that need to be made in order to meet our energy needs in a sustainable way. One of the most important choices is whether to invest in coal. Coal is a cheap and abundant source of energy, but it is also a major source of greenhouse gas emissions. Investing in coal is a risky proposition, but it is also a revenue-neutral carbon tax. A revenue-neutral carbon tax is a tax on carbon emissions that is designed to be revenue-neutral. This means that the tax is designed to raise the same amount of revenue as the cost of the carbon emissions that it is taxing. This is a key feature of a revenue-neutral carbon tax. It is designed to be revenue-neutral because it is designed to raise the same amount of revenue as the cost of the carbon emissions that it is taxing. This is a key feature of a revenue-neutral carbon tax. It is designed to be revenue-neutral because it is designed to raise the same amount of revenue as the cost of the carbon emissions that it is taxing.

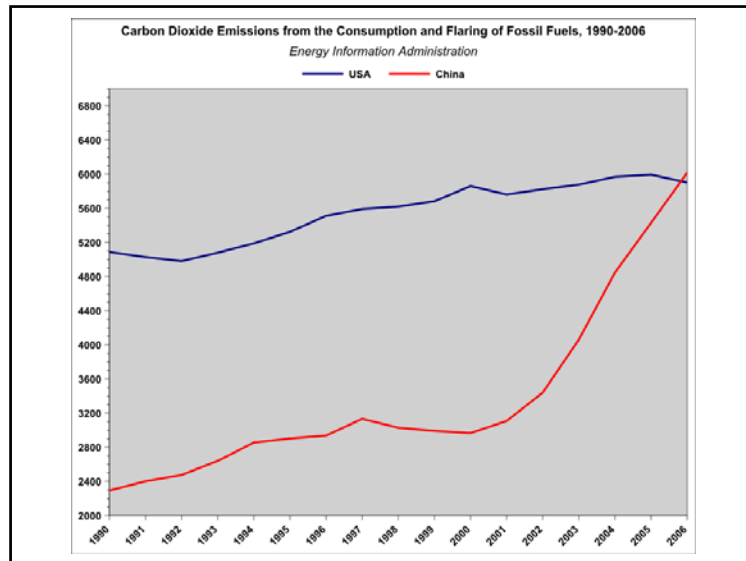

Universities Can Do Better Than Symbolism: A Revenue-Neutral Carbon Tax
 by Frank Wolak

The National Board of Trustees announced that it is choosing a new director of the Program on Energy and Sustainable Development. The search committee has selected Frank A. Wolak, a professor of economics at Stanford University, to lead the program. Wolak is a leading expert on energy policy and has been a member of the search committee. He is also a member of the search committee for the position of director of the Program on Energy and Sustainable Development.

Goal of University Carbon Charge

- Even if all major US research universities completely eliminated their GHG emissions footprint, this would not have a noticeable impact on global GHG emissions
- To put things in perspective, California's total GHG emissions reduction goals under AB 32 from 2013 to 2020 are offset by a few months of China's increase in GHG emissions
- Conclusion--On a direct benefit/cost ratio test, a university-level carbon charge fails
 - Direct costs are higher than direct climate benefits

Goal of University Carbon Tax

- Demonstration effect
 - “If it can work here, it can work anywhere”
 - Universities share many features in common with small open economies
 - If an effective carbon pricing system can be put in place at major research universities, then it will be easier to transfer it to national and international jurisdictions
- Universities can even link their carbon pricing programs, similar to how certain regional cap-and-trade programs have been linked
 - On January 1, 2014, California and Quebec linked their cap and trade programs for GHG emissions
- Sharing of lessons learned across universities

7

Goal of University Carbon Tax

- How can a university carbon charge satisfy expected benefits versus cost test?
 - “Demonstration Effect”
- Primary role of major research universities is teaching and research
- Many extremely challenging technical, economic, and political issues are associated with implementing a price on GHG emissions
 - Experience as member of Emissions Market Assessment Committee of California Air Resources Board
- Virtually all of these questions are ideally suited to be addressed by students and faculty at major research universities
 - Many fundamentally interdisciplinary problems to be solved

6

Dimensions of Demonstration Effect

- Channels student passion for addressing climate change into pointed study of real challenges that must be overcome to achieve a lower-carbon world
- Students and faculty use the university as a laboratory for working through the technical and practical challenges of pricing carbon
 - Fits with expertise of major research university
- Prepares students and faculty to bring their knowledge gained to real-world policy arena in state and country capitals
- Creates improved tools for measuring, & more awareness of an individual’s carbon footprint

8

Guiding Principles

- Academically rigorous and transparent process for determining life-cycle carbon content of products and activities
- Minimize additional administrative overhead to implement carbon price
- Relate carbon charge to daily activities of all members of the university community
 - Smart phone applications can provide feedback
- Amount of carbon charge paid should not be excessive
 - Recall earlier direct cost versus benefits calculation
- Encourage interaction and sharing of experiences with other interested parties
 - Maximize global demonstration effect

9

Concluding Comments

- “Don’t let the perfect be the enemy of the good”
 - Start with the easy to track and price sources of carbon
 - Increase salience of carbon implications of university activities
- Recognize that this is an ongoing process rather than a task to be completed
 - Initial program is bound to have flaws, so build in process of continuous improvement
 - Climate challenge is a long-term problem that requires “lifestyle” changes
- Ultimate goal is to price all carbon produced by university-related activities in manner that is scalable to real world
 - Maximize demonstration effect

11

Possible Areas for Further Study

- Tax and general legal implications of a non-profit institution assessing a carbon charge and refunding some or all of the revenues to students, faculty and staff
- Need for widespread investments in GHG emissions monitoring and measuring technology
 - If you can’t measure it, you can’t price it
 - Resolving source-based versus consumption-based measurement trade-off
- Pricing carbon content of goods and services consumed by university
 - Analogy to “border adjustments”
- Potential changes in university budgeting process with a price of carbon
 - Recall major source of benefits is demonstration effect
