

Key Concepts

- **Overall goal: reduce complexity**
 - Dependencies
 - Obscurity
- **Good design is an investment**
 - Tactical vs. strategic programming
- **Complexity is incremental: zero tolerance**
- **Abstraction: find simple ways to think about complicated things**
- **Information hiding**
 - Interface vs. implementation
- **Classes should be deep**
- **General-purpose classes are deeper**
- **Different layers should have different abstractions**
- **Pull complexity downward, push specialization upward**
- **Comments should describe things that aren't obvious from the code**
- **Comments are at a different level of precision than code**
- **Names matter!**
- **Define errors out of existence**
- **Code should be obvious**

Red Flags

- **Unnecessary specialization**
- **Shallow classes**
- **Information leakage**
 - Dependencies
 - Conjoined methods/classes
- **Temporal decomposition**
- **Pass-through methods**
- **Code duplication**
- **Special cases**
- **Inconsistencies**
- **Comment duplicates code**
- **Implementation contaminates interface documentation**
- **Documentation has to be long to be complete**
- **Vague names**
- **Code is not obvious**

Workloads

- If Project 1 was 1.0 unit of work, how many units were
- Project 2: 0.75, 0.7, 1, 1, 1.1, 0.7, 0.9, 0.9, 0.7, 0.4, 0.5, 1.3, 1.5, 1.5, 1.3, 0.6, 2.0, 0.5
- Project 3: 0.9, 0.8, 0.7, 0.7, 0.8, 1.0, 1.0, 0.8, 0.6, 0.5, 0.9, 0.9, 0.8, 0.7, 1.0, 0.75, 0.2
